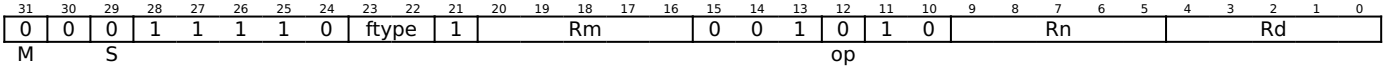
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FADD <Hd>, <Hn>, <Hm>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FADD <Sd>, <Sn>, <Sm>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FADD <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(ftype XOR '10');
```

Assembler Symbols

<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();
let operand1 : bits(esize) = V{}(n);
let operand2 : bits(esize) = V{}(m);

var result : bits(128) = if IsMerging(FPCR()) then V{128}(n) else Zeros{128};

result[0+:esize] = FPAdd{esize}(operand1, operand2, FPCR());

V{128}(d) = result;
```

FADDP (vector)

Floating-point add pairwise (vector)

This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, adds each pair of values together, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FAMAX

Floating-point absolute maximum

This instruction determines the maximum absolute value from floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and places the results in the corresponding elements of the destination vector.
The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

Half-precision

FAMIN

Floating-point absolute minimum

This instruction determines the minimum absolute value from floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and places the results in the corresponding elements of the destination vector.

The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FCADD

Floating-point complex add

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following calculation on the corresponding complex number element pairs from the two source registers:

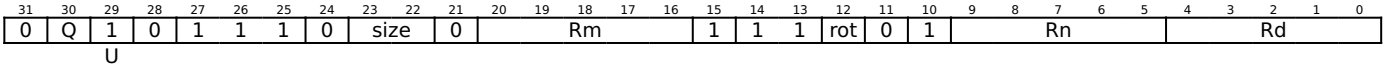
- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 90 or 270 degrees.
- The rotated complex number is added to the complex number from the first source register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_FCMA)



Encoding

FCCMP

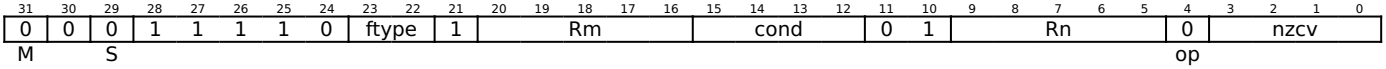
Floating-point conditional quiet compare (scalar)

This instruction, if the condition passes, has the following behavior:

- This instruction compares the two SIMD&FP source register values and writes the result to the *PSTATE*.{N, Z, C, V} flags.
- This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.
- This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

If the condition does not pass, then the comparison is not performed and the *PSTATE*.{N, Z, C, V} flags are set to the flag bit specifier.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FCCMP <Hn>, <Hm>, #<nzcv>, <cond>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FCCMP <Sn>, <Sm>, #<nzcv>, <cond>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FCCMP <Dn>, <Dm>, #<nzcv>, <cond>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 8 << UInt(ftype XOR '10');
let condition : bits(4) = cond;
var flags : bits(4) = nzcv;
```

Assembler Symbols

<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<nzcv>	Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.

<cond> Is one of the standard conditions, encoded in the standard way, and encoded in “cond”:

cond	<cond>
0000	EQ
0001	NE
0010	CS|HS
0011	CC|LO
0100	MI
0101	PL

1011	LT
1100	GT
1101	LE
1110	AL
1111	NV

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();

let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);

if ConditionHolds(condition) then
    let signal_all_nans : boolean = FALSE;
    flags = FPCompare{datasize}(operand1, operand2, signal_all_nans, FPCR());
end;

PSTATE.[N,Z,C,V] = flags;
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, >, or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2), and (Operand1 > Operand2) are false. An unordered comparison sets the PSTATE condition flags to N=0, Z=0, C=1, and V=1.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

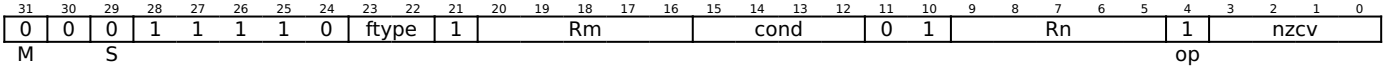
FCCMPE

Floating-point conditional signaling compare (scalar)

This instruction, if the condition passes, has the following behavior:

- This instruction compares the two SIMD&FP source register values and writes the result to the *PSTATE*.{N, Z, C, V} flags.
- This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.
- This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

If the condition does not pass, then the comparison is not performed and the *PSTATE*.{N, Z, C, V} flags are set to the flag bit specifier.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FCCMPE <Hn>, <Hm>, #<nzcv>, <cond>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FCCMPE <Sn>, <Sm>, #<nzcv>, <cond>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FCCMPE <Dn>, <Dm>, #<nzcv>, <cond>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 8 << UInt(ftype XOR '10');
let condition : bits(4) = cond;
var flags : bits(4) = nzcv;
```

Assembler Symbols

<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<nzcv>	Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.

<cond> Is one of the standard conditions, encoded in the standard way, and encoded in “cond”:

cond	<cond>
0000	EQ
0001	NE
0010	CS|HS
0011	CC|LO
0100	MI
0101	PL
0110	VS
0111	VC
1000	HI
1001	LS
1010	GE
1011	LT
1100	GT
1101	LE
1110	AL
1111	NV

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();

let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);

if ConditionHolds(condition) then
    let signal_all_nans : boolean = TRUE;
    flags = FPCompare{datasize}(operand1, operand2, signal_all_nans, FPCR());
end;

PSTATE.[N,Z,C,V] = flags;
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, >, or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2), and (Operand1 > Operand2) are false. FCMEQ (register)

Floating-point compare equal (vector)

This instruction compares each floating-point value from the first source SIMD&FP register, with the corresponding floating-point value from the second source SIMD&FP register, and if the comparison is equal sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

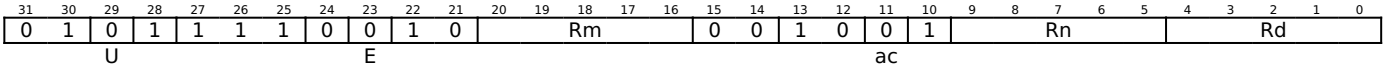
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FCMEQ <Hd>, <Hn>, <Hm>

FCMGT (zero)

Floating-point compare greater than zero (vector)

This instruction reads each floating-point value in the source SIMD&FP register and if the value is greater than zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

FCMLA

Floating-point complex multiply accumulate

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following calculation on the corresponding complex number element pairs from the two source registers and the destination register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FCMLA (by element)

Floating-point complex multiply accumulate (by element)

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following calculation on complex numbers from the first source register and the destination register with the specified complex number from the second source register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FCMLT (zero)

Floating-point compare less than zero (vector)

This instruction reads each floating-point value in the source SIMD&FP register and if the value is less than zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

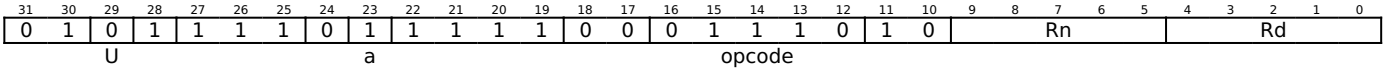
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FCMLT <Hd>, <Hn>, #0.0
```

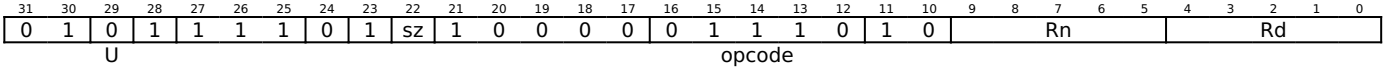
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 16;
let datasize : integer{} = esize;
let elements : integer = 1;
```

Scalar single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
FCMLT <V><d>, <V><n>, #0.0
```

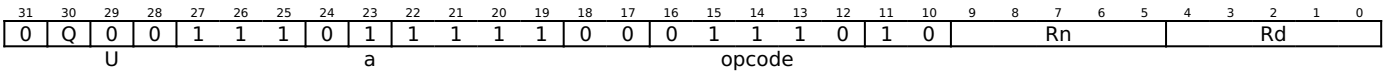
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 32 << UInt(sz);
let datasize : integer{} = esize;
let elements : integer = 1;
```

Vector half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FCMLT <Vd>.<T>, <Vn>.<T>, #0.0
```

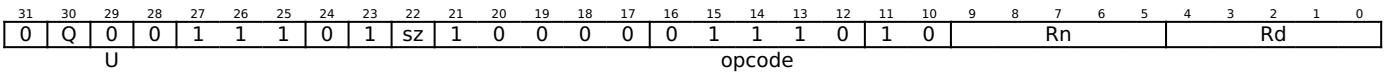
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 16;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Vector single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
FCMLT <Vd>.<T>, <Vn>.<T>, #0.0
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if sz::Q == '10' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 32 << UInt(sz);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<V> Is a width specifier, encoded in “sz”:

sz	<V>
0	S
1	D

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the "Vector half-precision" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "Vector single-precision and double-precision" variant: is an arrangement specifier, encoded in “(sz :: Q)”:

sz	Q	<T>
0	0	2S
0	1	4S
1	0	RESERVED
1	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
let zero : bits(esize) = FPZero{}('0');
var element : bits(esize);
var test_passed : boolean;

for e = 0 to elements-1 do
    element = operand[e*:esize];
    test_passed = FPCompareGT{esize}(zero, element, FPCR());
    result[e*:esize] = if test_passed then Ones{esize} else Zeros{esize};
end;

V{datasize}(d) = result;
```

FCMP

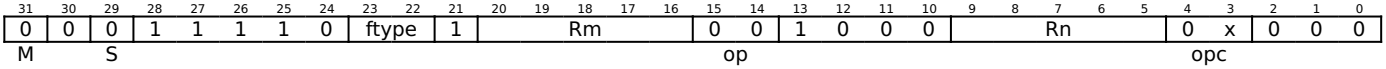
Floating-point quiet compare (scalar)

This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the *PSTATE*.{N, Z, C, V} flags.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant
(FEAT_FP16)

Applies when `(ftype == 11 && opc == 00)`

```
FCMP <Hn>, <Hm>
```

Encoding for the Half-precision, zero variant
(FEAT_FP16)

Applies when `(ftype == 11 && Rm == (00000) && opc == 01)`

```
FCMP <Hn>, #0.0
```

Encoding for the Single-precision variant
(FEAT_FP)

Applies when `(ftype == 00 && opc == 00)`

```
FCMP <Sn>, <Sm>
```

Encoding for the Single-precision, zero variant
(FEAT_FP)

Applies when `(ftype == 00 && Rm == (00000) && opc == 01)`

```
FCMP <Sn>, #0.0
```

Encoding for the Double-precision variant
(FEAT_FP)

Applies when `(ftype == 01 && opc == 00)`

```
FCMP <Dn>, <Dm>
```

Encoding for the Double-precision, zero variant
(FEAT_FP)

Applies when `(ftype == 01 && Rm == (00000) && opc == 01)`

```
FCMP <Dn>, #0.0
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let m : integer = UInt(Rm);   // ignored when opc<0> == '1'

let datasize : integer{} = 8 << UInt(ftype XOR '10');
let signal_all_nans : boolean = FALSE;
let cmp_with_zero : boolean = (opc[0] == '1');
```

Assembler Symbols

<Hn>	For the "Half-precision" variant: is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field. For the "Half-precision, zero" variant: is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sn>	For the "Single-precision" variant: is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

	For the "Single-precision, zero" variant: is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Dn>	For the "Double-precision" variant: is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
	For the "Double-precision, zero" variant: is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();

let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = if cmp_with_zero then FPZero{datasize}('0') else V{datasize}(m);

PSTATE.[N,Z,C,V] = FPCompare{datasize}(operand1, operand2, signal_all_nans, FPCR());
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, >, or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2), and (Operand1 > Operand2) are false. An unordered comparison sets the PSTATE condition flags to N=0, Z=0, C=1, and V=1.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

FCMPE

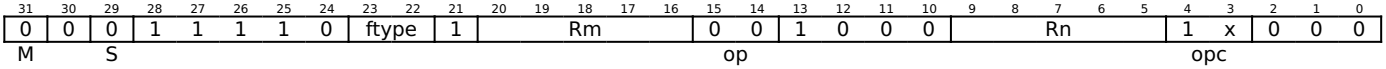
Floating-point signaling compare (scalar)

This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the *PSTATE*.{N, Z, C, V} flags.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant
(FEAT_FP16)

Applies when `(ftype == 11 && opc == 10)`

```
FCMPE <Hn>, <Hm>
```

Encoding for the Half-precision, zero variant

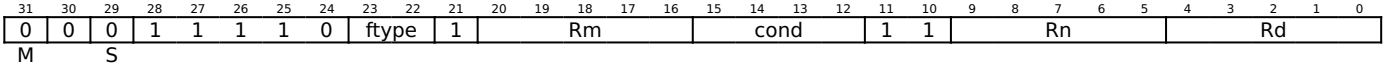
FCSEL

Floating-point conditional select (scalar)

This instruction allows the SIMD&FP destination register to take the value from either one or the other of two SIMD&FP source registers. If the condition passes, the first SIMD&FP source register value is taken, otherwise the second SIMD&FP source register value is taken.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FCSEL <Hd>, <Hn>, <Hm>, <cond>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FCSEL <Sd>, <Sn>, <Sm>, <cond>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FCSEL <Dd>, <Dn>, <Dm>, <cond>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let datasize : integer{} = 8 << UInt(ftype XOR '10');
let condition : bits(4) = cond;
```

Assembler Symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<cond> Is one of the standard conditions, encoded in the standard way, and encoded in “cond”:

cond	<cond>
0000	EQ
0001	NE
0010	CS|HS
0011	CC|LO
0100	MI
0101	PL
0110	VS
0111	VC
1000	HI
1001	LS
1010	GE
1011	LT
1100	GT
1101	LE
1110	AL
1111	NV

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();
var result : bits(datasize);

let condition_holds : boolean = ConditionHolds(condition);
result = if condition_holds then V{datasize}(n) else V{datasize}(m);

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

FCVT

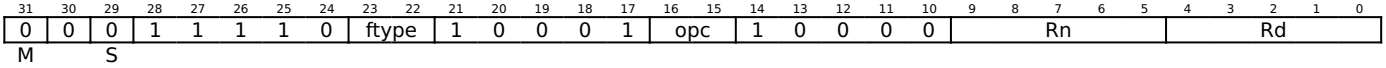
Floating-point convert precision (scalar)

This instruction converts the floating-point value in the SIMD&FP source register to the precision for the destination register data type using the rounding mode that is determined by the FPCR and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

(FEAT_FP)



Encoding for the Half-precision to single-precision variant

Applies when `(ftype == 11 && opc == 00)`

```
FCVT <Sd>, <Hn>
```

Encoding for the Half-precision to double-precision variant

Applies when `(ftype == 11 && opc == 01)`

```
FCVT <Dd>, <Hn>
```

Encoding for the Single-precision to half-precision variant

Applies when `(ftype == 00 && opc == 11)`

```
FCVT <Hd>, <Sn>
```

Encoding for the Single-precision to double-precision variant

Applies when `(ftype == 00 && opc == 01)`

```
FCVT <Dd>, <Sn>
```

Encoding for the Double-precision to half-precision variant

Applies when `(ftype == 01 && opc == 11)`

```
FCVT <Hd>, <Dn>
```

Encoding for the Double-precision to single-precision variant

Applies when `(ftype == 01 && opc == 00)`

```
FCVT <Sd>, <Dn>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == opc || ftype == '10' || opc == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

FCVTAS (scalar SIMD&FP)

Floating-point convert to signed integer, rounding to nearest with ties to away (scalar SIMD&FP)

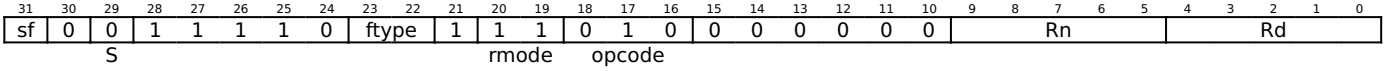
This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest with Ties to Away rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

(FEAT_FPRCVT)



Encoding for the Half-precision to 32-bit variant

Applies when `(sf == 0 && ftype == 11)`

```
FCVTAS <Sd>, <Hn>
```

Encoding for the Half-precision to 64-bit variant

Applies when `(sf == 1 && ftype == 11)`

```
FCVTAS <Dd>, <Hn>
```

Encoding for the Single-precision to 64-bit variant

Applies when `(sf == 1 && ftype == 00)`

```
FCVTAS <Dd>, <Sn>
```

Encoding for the Double-precision to 32-bit variant

Applies when `(sf == 0 && ftype == 01)`

```
FCVTAS <Sd>, <Dn>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FPRCVT) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if (sf == '0' && ftype == '00') || (sf == '1' && ftype == '01') then EndOfDecode(Decode_UNDEF); end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let intsize : integer{} = 32 << UInt(sf);
let fltsize : integer{} = 8 << UInt(ftype XOR '10');
```

Assembler Symbols

<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dn>	Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();

var fltval : bits(fltsize);
var intval : bits(intsize);
let merge : boolean = IsMerging(FPCR());
var result : bits(128) = if merge then V{128}(d) else Zeros{128};

fltval = V{fltsize}(n);
intval = FPToFixed{intsize, fltsize}(fltval, 0, FALSE, FPCR(), FPRounding_TIEAWAY);
result[0+:intsize] = intval;

V{128}(d) = result;
```

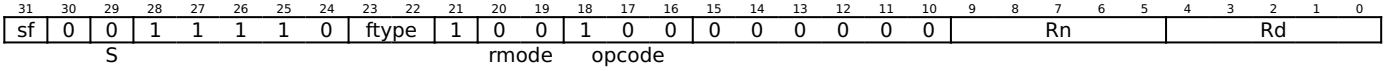
FCVTAS (scalar)

Floating-point convert to signed integer, rounding to nearest with ties to away (scalar)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest with Ties to Away rounding mode, and writes the result to the general-purpose destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision to 32-bit variant (FEAT_FP16)

Applies when `(sf == 0 && ftype == 11)`

```

FCVTAS (vector)

Floating-point convert to signed integer, rounding to nearest with ties to away (vector)

This instruction converts each element in a vector from a floating-point value to a signed integer value using the Round to Nearest with Ties to Away rounding mode and writes the result to the SIMD&FP destination register.

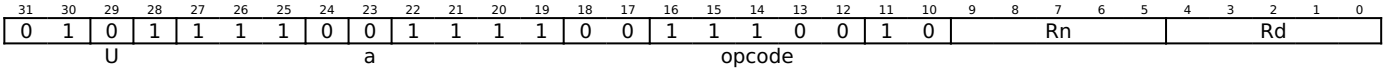
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FCVTAS <Hd>, <Hn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

FCVTL, FCVTL2

Floating-point convert to higher precision long (vector)

This instruction reads each element in a vector in the SIMD&FP source register, converts each value to double the precision of the source element using the rounding mode that is determined by the FPCR, and writes each result to the equivalent element of the vector in the SIMD&FP destination register.

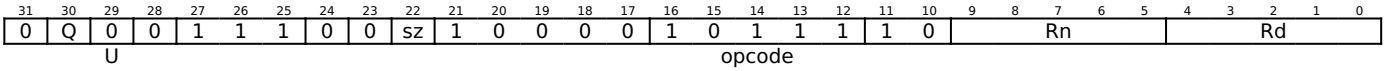
Where the operation lengthens a 64-bit vector to a 128-bit vector, the `FCVTL2` variant operates on the elements in the top 64 bits of the source register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
FCVTL{2} <Vd>.<Ta>, <Vn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let esize : integer{} = 16 << UInt(sz);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “sz”:

sz	<Ta>
0	4S
1	2D

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(sz :: Q)”:

sz	Q	<Tb>
0	0	4H
0	1	8H
1	0	2S
1	1	4S

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = Vpart{}(n, part);
var result : bits(2*datasize);

for e = 0 to elements-1 do
    result[e*:(2*esize)] = FPConvert{2*esize, esize}(operand[e*:esize], FPCR());
end;

V{2*datasize}(d) = result;
```

FCVTMU (scalar SIMD&FP)

Floating-point convert to unsigned integer, rounding toward minus infinity (scalar SIMD&FP)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round toward Minus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

FCVTMU (scalar)

Floating-point convert to unsigned integer, rounding toward minus infinity (scalar)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round towards Minus Infinity rounding mode, and writes the result to the general-purpose destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FCVTMU (vector)

Floating-point convert to unsigned integer, rounding toward minus infinity (vector)

This instruction converts a scalar or each element in a vector from a floating-point value to an unsigned integer value using the Round towards Minus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

FCVTN (half-precision to 8-bit floating-point)

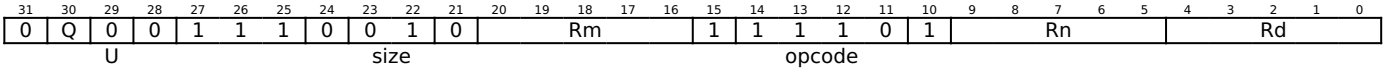
Half-precision convert to 8-bit floating-point (vector)

This instruction converts half-precision elements of the two source vectors to 8-bit floating-point while scaling the values by $2^{\mathrm{SInt(FPMR.NSCALE[4:0])}}$, and places the in-order results in the 8-bit elements of the destination vector.

The 8-bit floating-point encoding format is selected by FPMR.F8D.

Advanced SIMD

(FEAT_FP8)



Encoding

```
FCVTN <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP8) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = if Q == '1' then 128 else 64;
let elements : integer = datasize DIV 16;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	8B
1	16B

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	4H
1	8H

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

FCVTN, FCVTN2 (double to single-precision, single to half-precision)

Floating-point convert to lower precision narrow (vector)

This instruction reads each vector element in the SIMD&FP source register, converts each result to half the precision of the source element, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The rounding mode is determined by the FPCR.

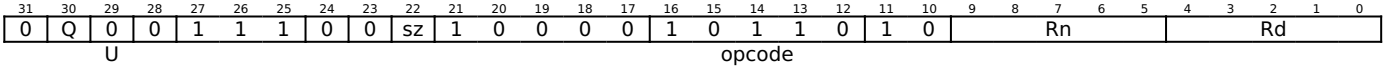
FCVTN writes the vector to the lower half of the destination register and clears the upper half. FCVTN2 writes the vector to the upper half of the destination register without affecting the other bits of the register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
FCVTN{2} <Vd>.<Tb>, <Vn>.<Ta>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let esize : integer{} = 16 << UInt(sz);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in “(sz :: Q)”:

sz	Q	<Tb>
0	0	4H
0	1	8H
1	0	2S
1	1	4S

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> — Is an arrangement specifier, encoded in “sz”:

sz	<Ta>
0	4S
1	2D

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(2*datasize) = V{}(n);
var result : bits(datasize);

for e = 0 to elements-1 do
    result[e*:esize] = FPConvert{esize, 2*esize}(operand[e*:(2*esize)], FPCR());
end;

Vpart{datasize}(d, part) = result;
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

FCVTN, FCVTN2 (single-precision to 8-bit floating-point)

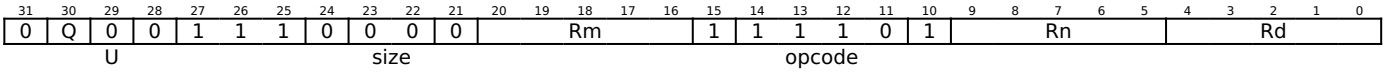
Single-precision convert to 8-bit floating-point (vector)

This instruction converts each single-precision element of the two source vectors to 8-bit floating-point while scaling the value by $2^{\mathrm{SInt(FPMR.NSCALE)}}$, and places the in-order results in the 8-bit elements of the lower or upper half of the destination vector. `FCVTN` writes the results to the lower half of the destination vector and clears the upper half. `FCVTN2` writes the results to the upper half of the destination vector without affecting the other bits of the vector.

The 8-bit floating-point encoding format is selected by FPMR.F8D.

Advanced SIMD

(FEAT_FP8)



Encoding

FCVTNS (scalar SIMD&FP)

Floating-point convert to signed integer, rounding to nearest with ties to even (scalar SIMD&FP)

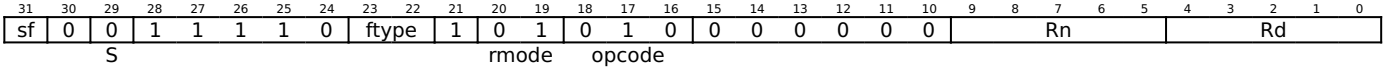
This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest with Ties to Even rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

(FEAT_FPRCVT)



Encoding for the Half-precision to 32-bit variant

Applies when `(sf == 0 && ftype == 11)`

```
FCVTNS <Sd>, <Hn>
```

Encoding for the Half-precision to 64-bit variant

Applies when `(sf == 1 && ftype == 11)`

```
FCVTNS <Dd>, <Hn>
```

Encoding for the Single-precision to 64-bit variant

Applies when `(sf == 1 && ftype == 00)`

```
FCVTNS <Dd>, <Sn>
```

Encoding for the Double-precision to 32-bit variant

Applies when `(sf == 0 && ftype == 01)`

```
FCVTNS <Sd>, <Dn>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FPRCVT) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if (sf == '0' && ftype == '00') || (sf == '1' && ftype == '01') then EndOfDecode(Decode_UNDEF); end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let intsize : integer{} = 32 << UInt(sf);
let fltsize : integer{} = 8 << UInt(ftype XOR '10');
```

Assembler Symbols

<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

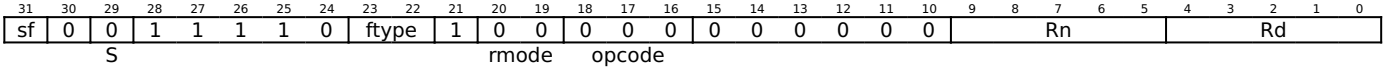
FCVTNS (scalar)

Floating-point convert to signed integer, rounding to nearest with ties to even (scalar)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest rounding mode, and writes the result to the general-purpose destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision to 32-bit variant (FEAT_FP16)

Applies when `(sf == 0 && ftype == 11)`

```
FCVTNS <Wd>, <Hn>
```

Encoding for the Half-precision to 64-bit variant (FEAT_FP16)

Applies when `(sf == 1 && ftype == 11)`

```
FCVTNS <Xd>, <Hn>
```

Encoding for the Single-precision to 32-bit variant (FEAT_FP)

Applies when `(sf == 0 && ftype == 00)`

```
FCVTNS <Wd>, <Sn>
```

Encoding for the Single-precision to 64-bit variant (FEAT_FP)

Applies when `(sf == 1 && ftype == 00)`

```
FCVTNS <Xd>, <Sn>
```

Encoding for the Double-precision to 32-bit variant (FEAT_FP)

Applies when `(sf == 0 && ftype == 01)`

```
FCVTNS <Wd>, <Dn>
```

Encoding for the Double-precision to 64-bit variant (FEAT_FP)

Applies when `(sf == 1 && ftype == 01)`

```
FCVTNS <Xd>, <Dn>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let intsize : integer{} = 32 << UInt(sf);
let fltsize : integer{} = 8 << UInt(ftype XOR '10');

let rounding : FPRounding = FPRounding_TIEEVEN;
let unsigned : boolean    = FALSE;
```

Assembler Symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dn>	Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPEnabled();

let fltval : bits(fltsize) = V{}(n);
let fracbits : integer = 0;

X{intsize}(d) = FPToFixed{intsize, fltsize}(fltval, fracbits, unsigned, FPCR(), rounding);
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

FCVTNS (vector)

Floating-point convert to signed integer, rounding to nearest with ties to even (vector)

This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round to Nearest rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

FCVTPS (vector)

Floating-point convert to signed integer, rounding toward plus infinity (vector)

This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

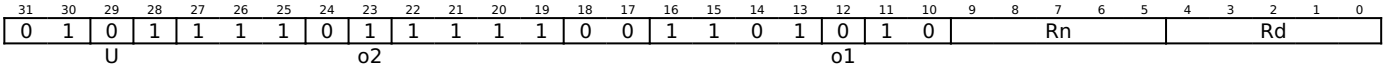
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FCVTPS <Hd>, <Hn>
```

Decode for this encoding

```

FCVTPU (scalar SIMD&FP)

Floating-point convert to unsigned integer, rounding toward plus infinity (scalar SIMD&FP)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round toward Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

FCVTXN, FCVTXN2

Floating-point convert to lower precision narrow, rounding to odd (vector)

This instruction reads each double-precision element in the source SIMD&FP register, converts each value to single-precision format using the Round to Odd rounding mode, and writes the results to the destination SIMD&FP register.

Note

This instruction uses the Round to Odd rounding mode, which is not defined by the IEEE 754-2008 standard. This rounding mode ensures that if the result of the conversion is inexact, the least significant bit of the mantissa is forced to 1. This rounding mode enables a floating-point value to be converted to a lower precision format using an intermediate precision format while avoiding double rounding errors. For example, a 64-bit floating-point value can be converted to a correctly rounded 16-bit floating-point value by first using this instruction to produce a 32-bit value and then using another instruction with the wanted rounding mode to convert the 32-bit value to the final 16-bit floating-point value.

The Vector variant of `FCVTXN` writes the half-width results to the lower half of the destination register and clears the upper half to 0. `FCVTXN2` writes the half-width results to the upper half of the destination register without affecting the other bits of the register.

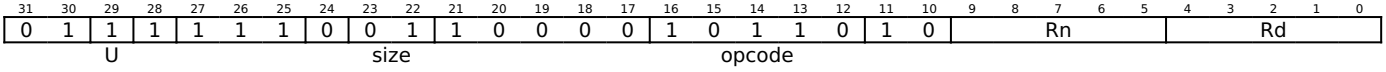
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

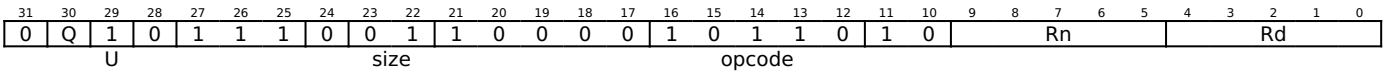
```
FCVTXN S<d>, D<n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 32;
let datasize : integer{} = esize;
let elements : integer = 1;
let part : integer = 0;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
FCVTXN{2} <Vd>.<Tb>, <Vn>.2D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 32;
let datasize : integer{} = 64;
let elements : integer = 2;
let part : integer = UInt(Q);
```

Assembler Symbols

<d>	Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
<n>	Is the number of the SIMD&FP source register, encoded in the "Rn" field.

2 Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	2S
1	4S

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let operand : bits(2*datasize) = V{}(n);
let merge : boolean = elements == 1 && IsMerging(FPCR());
var result : bits(128) = if merge then V{128}(d) else Zeros{128};

for e = 0 to elements-1 do
    result[e*:esize] = FPConvert{esize, 2*esize}(operand[e*:(2*esize)], FPCR(), FPRounding_ODD);
end;

if merge then
    V{128}(d) = result;
else
    Vpart{datasize}(d, part) = result[0+:datasize];
end;
```

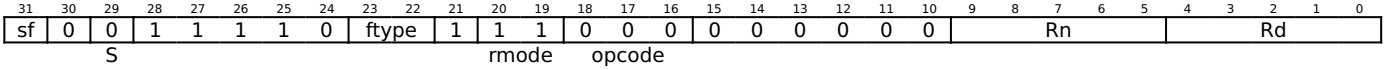
FCVTZS (scalar, integer)

Floating-point convert to signed integer, rounding toward zero (scalar)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision to 32-bit variant (FEAT_FP16)

Applies when `(sf == 0 && ftype == 11)`

```
FCVTZS <Wd>, <Hn>
```

Encoding for the Half-precision to 64-bit variant (FEAT_FP16)

Applies when `(sf == 1 && ftype == 11)`

```
FCVTZS <Xd>, <Hn>
```

Encoding for the Single-precision to 32-bit variant (FEAT_FP)

Applies when `(sf == 0 && ftype == 00)`

```
FCVTZS <Wd>, <Sn>
```

Encoding for the Single-precision to 64-bit variant (FEAT_FP)

Applies when `(sf == 1 && ftype == 00)`

```
FCVTZS <Xd>, <Sn>
```

Encoding for the Double-precision to 32-bit variant (FEAT_FP)

Applies when `(sf == 0 && ftype == 01)`

```
FCVTZS <Wd>, <Dn>
```

Encoding for the Double-precision to 64-bit variant (FEAT_FP)

Applies when `(sf == 1 && ftype == 01)`

```
FCVTZS <Xd>, <Dn>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let intsize : integer{} = 32 << UInt(sf);
let fltsize : integer{} = 8 << UInt(ftype XOR '10');

let rounding : FPRounding = FPRounding_ZERO;
let unsigned : boolean    = FALSE;
```

Assembler Symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dn>	Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPEnabled();

FCVTZU (scalar SIMD&FP)

Floating-point convert to unsigned integer, rounding toward zero (scalar SIMD&FP)

This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round toward Zero rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

FCVTZU (vector, integer)

Floating-point convert to unsigned integer, rounding toward zero (vector)

This instruction converts a scalar or each element in a vector from a floating-point value to an unsigned integer value using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

FDOT (8-bit floating-point to half-precision, by element)

8-bit floating-point dot product to half-precision (vector, by element)

This instruction calculates the fused sum-of-products of a pair of 8-bit floating-point values held in each 16-bit element of the first source vector and a pair of 8-bit floating-point values in an indexed 16-bit element of the second source vector. The half-precision sum-of-products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$, before being destructively added without intermediate rounding to the corresponding half-precision elements of the destination vector.

The 8-bit floating-point groups within the second source vector are specified using an immediate index.

The 8-bit floating-point encoding format for the elements of the first source vector is selected by FPMR.F8S1. The 8-bit floating-point encoding format for the elements of the second source vector is selected by FPMR.F8S2.

Advanced SIMD

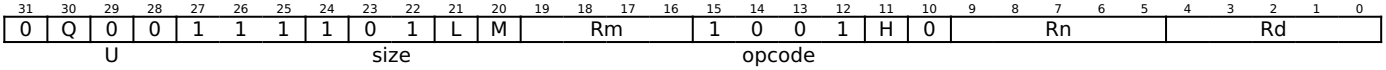
FDOT (half-precision to single-precision, by element)

Half-precision dot product to single-precision (vector, by element)

This instruction calculates the fused sum-of-products of a pair of half-precision values held in each 32-bit element of the first source vector and a pair of half-precision values held in an indexed 32-bit element of the second source vector, without intermediate rounding, and then destructively adds the single-precision sum-of-products to the corresponding single-precision element of the destination vector.

Advanced SIMD

(FEAT_F16F32DOT)



Encoding

```
FDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.2H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_F16F32DOT) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(M::Rm);
let d : integer = UInt(Rd);
let i : integer = UInt(H::L);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 32;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	2S
1	4S

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	4H
1	8H

<Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<index> Is the immediate index of a pair of 16-bit elements in the range 0 to 3, encoded in the "H:L" fields.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(128) = V{}(m);
let operand3 : bits(datasize) = V{}(d);
var result : bits(datasize);

for e = 0 to elements-1 do
    let elt1_a : bits(16) = operand1[(2 * e + 0)*:16];
    let elt1_b : bits(16) = operand1[(2 * e + 1)*:16];
    let elt2_a : bits(16) = operand2[(2 * i + 0)*:16];
    let elt2_b : bits(16) = operand2[(2 * i + 1)*:16];

    let sum : bits(32) = operand3[e*:32];
    result[e*:32] = FPDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
end;

V{datasize}(d) = result;
```

FJCVTZS

Floating-point JavaScript convert to signed fixed-point, rounding toward zero

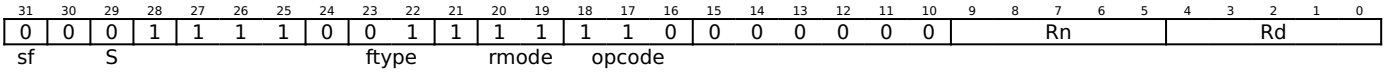
This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register. If the result is too large to be represented as a signed 32-bit integer, then the result is the integer modulo 2^{32}, as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Double-precision to 32-bit

(FEAT_JSCVT)



Encoding

```
FJCVTZS <Wd>, <Dn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_JSCVT) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
```

Assembler Symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Dn>	Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let fltval : bits(64) = V{}(n);

var intval : bits(32);
var z : bit;
(intval, z) = FPToFixedJS(fltval, FPCR());

X{32}(d) = intval;
PSTATE.[N,Z,C,V] = '0'::z::'00';
```

FMADD

Floating-point fused multiply-add (scalar)

This instruction multiplies the values of the first two SIMD&FP source registers, adds the product to the value of the third SIMD&FP source register, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMAX (scalar)

Floating-point maximum (scalar)

This instruction compares the two source SIMD&FP registers, and writes the larger of the two floating-point values to the destination SIMD&FP register.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either value is a NaN, the result is a quiet NaN derived as follows:
  - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
  - Otherwise, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both values are zeros, regardless of the sign of either zero, the result is the second value.
- If either value is a NaN, regardless of the value of FPCR.DN, the result is the second value.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMAX (vector)

Floating-point maximum (vector)

This instruction compares corresponding vector elements in the two source SIMD&FP registers, places the larger of each of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FMAXNMP (scalar)

Floating-point maximum number of pair of elements (scalar)

This instruction compares two vector elements in the source SIMD&FP register and writes the largest of the floating-point values as a scalar to the destination SIMD&FP register.

The behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

Half-precision

(FEAT_AdvSIMD && FEAT_FP16)

FMAXNMP (vector)

Floating-point maximum number pairwise (vector)

This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.
The behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMAXNMV

Floating-point maximum number across vector

This instruction compares all the vector elements in the source SIMD&FP register, and writes the largest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are floating-point values.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision

FMAXP (scalar)

Floating-point maximum of pair of elements (scalar)

This instruction compares two vector elements in the source SIMD&FP register and writes the largest of the floating-point values as a scalar to the destination SIMD&FP register.

When FPCR.AH is 0, the behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows for each pairwise operation:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FMIN (vector)

Floating-point minimum (vector)

This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the smaller of each of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMINNM (scalar)

Floating-point minimum number (scalar)

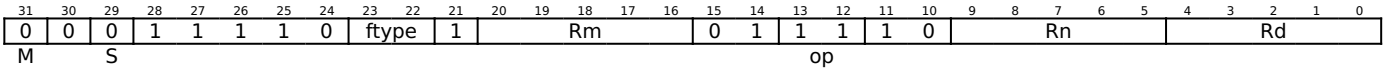
This instruction compares the first and second source SIMD&FP register values, and writes the smaller of the two floating-point values to the destination SIMD&FP register.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant
(FEAT_FP16)

Applies when `(ftype == 11)`

```
FMINNM <Hd>, <Hn>, <Hm>
```

Encoding for the Single-precision variant
(FEAT_FP)

Applies when `(ftype == 00)`

```
FMINNM <Sd>, <Sn>, <Sm>
```

Encoding for the Double-precision variant
(FEAT_FP)

Applies when `(ftype == 01)`

```
FMINNM <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;

FMINNM (vector)

Floating-point minimum number (vector)

This instruction compares corresponding vector elements in the two source SIMD&FP registers, writes the smaller of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FMINNMP (vector)

Floating-point minimum number pairwise (vector)

This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of floating-point values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

The behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FMINP (scalar)

Floating-point minimum of pair of elements (scalar)

This instruction compares two vector elements in the source SIMD&FP register and writes the smallest of the floating-point values as a scalar to the destination SIMD&FP register.

When FPCR.AH is 0, the behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows for each pairwise operation:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMINP (vector)

Floating-point minimum pairwise (vector)

This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, writes the smaller of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

When FPCR.AH is 0, the behavior is as follows for each pairwise operation:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows for each pairwise operation:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FMINV

Floating-point minimum across vector

This instruction compares all the vector elements in the source SIMD&FP register, and writes the smallest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are floating-point values.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either value is a NaN, the result is a quiet NaN derived as follows:
  - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
  - Otherwise, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both values are zeros, regardless of the sign of either zero, the result is the second value.
- If either value is a NaN, regardless of the value of FPCR.DN, the result is the second value.

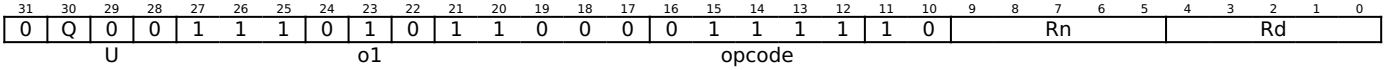
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision

Half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FMINV <V><d>, <Vn>.<T>
```

Decode for this encoding

FMLAL, FMLAL2 (by element)

Floating-point fused multiply-add long to accumulator (by element)

This instruction multiplies the half-precision vector elements in the first source SIMD&FP register by the specified half-precision value in the second source SIMD&FP register, and accumulates the intermediate product without rounding to the corresponding single-precision vector element of the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4, it is mandatory for all implementations to support it.

Note

ID_AA64ISAR0_EL1.FHM indicates whether this instruction is supported.

It has encodings from 2 classes: FMLAL and FMLAL2

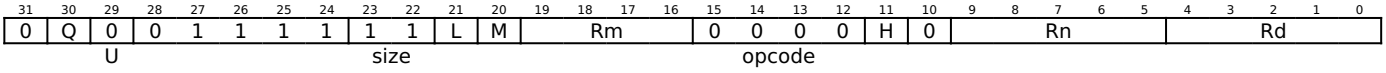
FMLALB, FMLALT (by element)

8-bit floating-point multiply-add to half-precision (vector, by element)

This instruction widens the even-numbered (bottom) or odd-numbered (top) 8-bit elements in the first source vector and the indexed element from the second source vector to half-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$, before being destructively added without intermediate rounding to the half-precision elements of the destination vector that overlap with the corresponding 8-bit floating-point elements in the first source vector.
The 8-bit floating-point encoding format for the elements of the first source vector is selected by FPMR.F8S1. The 8-bit floating-point encoding format for the elements of the second source vector is selected by FPMR.F8S2.

Advanced SIMD

(FEAT_FP8FMA)



Encoding for the FMLALB variant

Applies when `(Q == 0)`

```
FMLALB <Vd>.8H, <Vn>.16B, <Vm>.B[<index>]
```

Encoding for the FMLALT variant

Applies when `(Q == 1)`

```
FMLALT <Vd>.8H, <Vn>.16B, <Vm>.B[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP8FMA) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt('00'::Rm[2:0]);
let d : integer = UInt(Rd);
let index : integer = UInt(H::L::M::Rm[3]);
let elements : integer = 128 DIV 16;
let sel : integer = UInt(Q);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

FMLALLBB, FMLALLBT, FMLALLTB, FMLALLTT (by element)

8-bit floating-point multiply-add to single-precision (vector, by element)

This instruction widens the first (bottom bottom), second (bottom top), third (top bottom), or fourth (top top) 8-bit element of each 32-bit container in the first source vector and the indexed element from the second source vector to single-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-\text{UInt(FPMR.LSCALE)}}$, before being destructively added without intermediate rounding to the single-precision elements of the destination vector that overlap with the corresponding 8-bit floating-point elements in the first source vector. The 8-bit floating-point encoding format for the elements of the first source vector is selected by FPMR.F8S1. The 8-bit floating-point encoding format for the elements of the second source vector is selected by FPMR.F8S2.

Advanced SIMD

FMLS (by element)

Floating-point fused multiply-subtract from accumulator (by element)

This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and subtracts the results from the vector elements of the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar, half-precision , Scalar, single-precision and double-precision , Vector, half-precision and Vector, single-precision and double-precision

Scalar, half-precision

FMLS (vector)

Floating-point fused multiply-subtract from accumulator (vector)

This instruction multiplies corresponding floating-point values in the vectors in the two source SIMD&FP registers, negates the product, adds the result to the corresponding vector element of the destination SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

FMLSL, FMLSL2 (by element)

Floating-point fused multiply-subtract long from accumulator (by element)

This instruction multiplies the negated half-precision vector elements in the first source SIMD&FP register by the specified half-precision value in the second source SIMD&FP register, and accumulates the intermediate product without rounding to the corresponding single-precision vector element of the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4, it is mandatory for all implementations to support it.

Note

ID_AA64ISAR0_EL1.FHM indicates whether this instruction is supported.

It has encodings from 2 classes: FMLSL and FMLSL2

FMMLA (non-widening)

Half-precision matrix multiply-accumulate

This instruction multiplies the 2x2 matrix of half-precision values in each 64-bit segment of the first source vector by the 2x2 matrix of half-precision values in the corresponding 64-bit segment of the second source vector. The intermediate products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the 2x2 half-precision matrix held in the corresponding 64-bit segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element.

FMMLA (widening, 8-bit floating-point to half-precision)

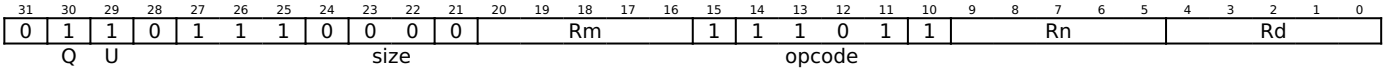
8-bit floating-point matrix multiply-accumulate to half-precision

This instruction multiplies the 2×4 matrix of 8-bit floating-point values held in each 64-bit segment of the first source vector by the 4×2 matrix of 8-bit floating-point values in the corresponding segment of the second source vector. The intermediate half-precision results, calculated as a fused sum-of-products using four adjacent 8-bit floating-point values from each of the source vectors, are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$ before being destructively added without intermediate rounding to the 2x2 half-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating 4-way dot product per destination element.

The 8-bit floating-point encoding format for the elements of the first source vector is selected by FPMR.F8S1. The 8-bit floating-point encoding format for the elements of the second source vector is selected by FPMR.F8S2.

Advanced SIMD

(FEAT_F8F16MM)



Encoding

```
FMMLA <Vd>.8H, <Vn>.16B, <Vm>.16B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_F8F16MM) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let d : integer = UInt(Rd);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPMREnabled();
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(128) = V{}(n);
let operand2 : bits(128) = V{}(m);
let operand3 : bits(128) = V{}(d);

var result : bits(128);
var op1, op2, acc : bits(64);

for s = 0 to 1 do
    op1 = operand1[s*:64];
    op2 = operand2[s*:64];
    acc = operand3[s*:64];
    result[s*:64] = FP8MatMulAddFP{64}(acc, op1, op2, 4, FPCR(), FPMR());
end;

V{128}(d) = result;
```

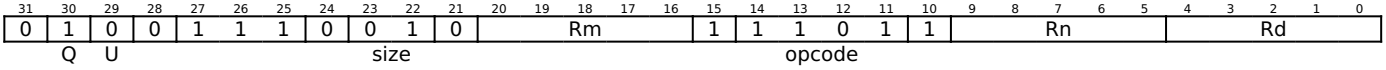
FMMLA (widening, half-precision to single-precision)

Half-precision matrix multiply-accumulate to single-precision

This instruction multiplies the 2×4 matrix of half-precision values held in the first source vector by the 4×2 matrix of half-precision values in the second source vector. The intermediate single-precision results are calculated as a sum of two fused sum-of-products using two pairs of adjacent half-precision values from each of the source vectors, and rounded before accumulation into the 2×2 matrix of single-precision results in the destination vector. This is equivalent to performing a 4-way dot product per destination element.

Advanced SIMD

(FEAT_F16F32MM)



Encoding

```
FMMLA <Vd>.4S, <Vn>.8H, <Vm>.8H
```

Decode for this encoding

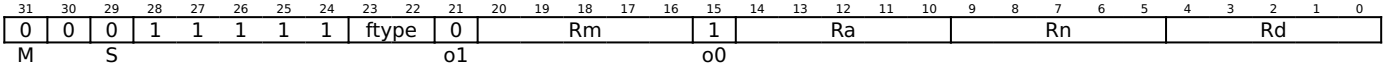
FMSUB

Floating-point fused multiply-subtract (scalar)

This instruction multiplies the values of the first two SIMD&FP source registers, negates the product, adds that to the value of the third SIMD&FP source register, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FMSUB <Hd>, <Hn>, <Hm>, <Ha>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

FMUL (by element)

Floating-point multiply (by element)

This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar, half-precision , Scalar, single-precision and double-precision , Vector, half-precision and Vector, single-precision and double-precision

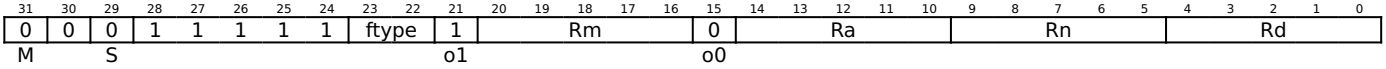
FNMADD

Floating-point negated fused multiply-add (scalar)

This instruction multiplies the values of the first two SIMD&FP source registers, negates the product, subtracts the value of the third SIMD&FP source register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FNMADD <Hd>, <Hn>, <Hm>, <Ha>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FNMADD <Sd>, <Sn>, <Sm>, <Sa>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FNMADD <Dd>, <Dn>, <Dm>, <Da>
```

Decode for all variants of this encoding

```

FRINT32X (scalar)

Floating-point round to 32-bit integer, using current rounding mode (scalar)

This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value that fits into a 32-bit integer size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

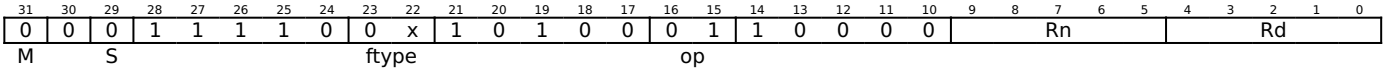
A zero input returns a zero result with the same sign. When the result value is not numerically equal to the input value, an Inexact exception is raised. When the input is infinite, NaN or out-of-range, the instruction returns the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

(FEAT_FRINTTS)



Encoding for the Single-precision variant

Applies when `(ftype == 00)`

FRINT32X (vector)

Floating-point round to 32-bit integer, using current rounding mode (vector)

This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values that fit into a 32-bit integer size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

A zero input returns a zero result with the same sign. When one of the result values is not numerically equal to the corresponding input value, an Inexact exception is raised. When an input is infinite, NaN or out-of-range, the instruction returns for the corresponding result value the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector single-precision and double-precision

FRINT32Z (scalar)

Floating-point round to 32-bit integer toward zero (scalar)

This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value that fits into a 32-bit integer size using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register.

A zero input returns a zero result with the same sign. When the result value is not numerically equal to the input value, an Inexact exception is raised. When the input is infinite, NaN or out-of-range, the instruction returns the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FRINTI (scalar)

Floating-point round to integral, using current rounding mode (scalar)

This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value of the same size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FRINTI (vector)

Floating-point round to integral, using current rounding mode (vector)

This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

Half-precision

FRINTX (scalar)

Floating-point round to integral exact, using current rounding mode (scalar)

This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value of the same size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

When the result value is not numerically equal to the input value, an Inexact exception is raised. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FRINTX (vector)

Floating-point round to integral exact, using current rounding mode (vector)

This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the rounding mode that is determined by the FPCR, and writes the result to the SIMD&FP destination register.

When a result value is not numerically equal to the corresponding input value, an Inexact exception is raised. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

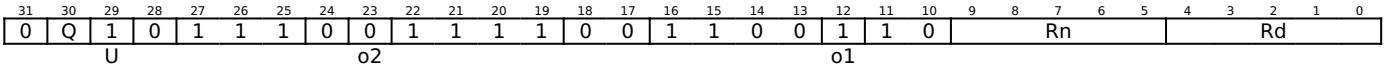
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

Half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
FRINTX <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```

FRSQRTS

Floating-point reciprocal square root step

This instruction multiplies corresponding floating-point values in the vectors of the two source SIMD&FP registers, subtracts each of the products from 3.0, divides these results by 2.0, places the results into a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the "Half-precision" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "Single-precision and double-precision" variant: is an arrangement specifier, encoded in “(sz :: Q)”:

sz	Q	<T>
0	0	2S
0	1	4S
1	0	RESERVED
1	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);

for e = 0 to elements-1 do
    let element : bits(esize) = operand[e*:esize];
    result[e*:esize] = FPSqrt{esize}(element, FPCR());
end;

V{datasize}(d) = result;
```

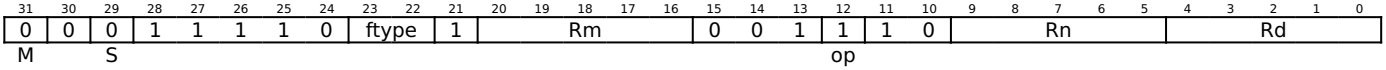
FSUB (scalar)

Floating-point subtract (scalar)

This instruction subtracts the floating-point value of the second source SIMD&FP register from the floating-point value of the first source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.



Encoding for the Half-precision variant (FEAT_FP16)

Applies when `(ftype == 11)`

```
FSUB <Hd>, <Hn>, <Hm>
```

Encoding for the Single-precision variant (FEAT_FP)

Applies when `(ftype == 00)`

```
FSUB <Sd>, <Sn>, <Sm>
```

Encoding for the Double-precision variant (FEAT_FP)

Applies when `(ftype == 01)`

```
FSUB <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if ftype == '10' then EndOfDecode(Decode_UNDEF); end;
if ftype == '11' && !IsFeatureImplemented(FEAT_FP16) then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(ftype XOR '10');
```

Assembler Symbols

<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPEnabled();
let operand1 : bits(esize) = V{}(n);
let operand2 : bits(esize) = V{}(m);

var result : bits(128) = if IsMerging(FPCR()) then V{128}(n) else Zeros{128};

result[0+:esize] = FPSub{esize}(operand1, operand2, FPCR());

V{128}(d) = result;
```

FSUB (vector)

Floating-point subtract (vector)

This instruction subtracts the elements in the vector in the second source SIMD&FP register, from the corresponding elements in the vector in the first source SIMD&FP register, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

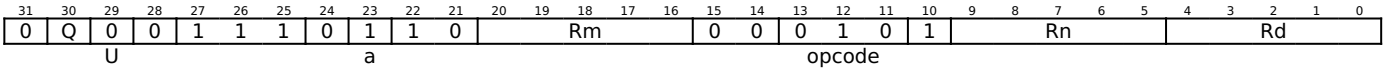
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Half-precision and Single-precision and double-precision

Half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

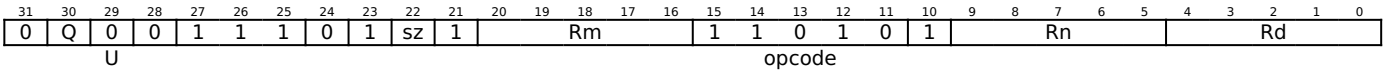
```
FSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 16;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
FSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if sz::Q == '10' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 32 << UInt(sz);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the "Half-precision" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "Single-precision and double-precision" variant: is an arrangement specifier, encoded in “(sz :: Q)”:

sz	Q	<T>
0	0	2S
0	1	4S
1	0	RESERVED
1	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);

var element1 : bits(esize);
var element2 : bits(esize);
var result : bits(datasize);

for e = 0 to elements-1 do
    element1 = operand1[e*:esize];
    element2 = operand2[e*:esize];
    result[e*:esize] = FPSub{esize}(element1, element2, FPCR());
end;

V{datasize}(d) = result;
```

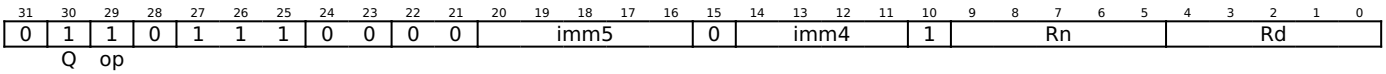
INS (element)

Insert vector element from another vector element

This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register. This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
This instruction is used by the alias MOV (element).

Advanced SIMD

(FEAT_AdvSIMD)



Encoding

```
INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if imm5 == 'x0000' then EndOfDecode(Decode_UNDEF); end;
let size : integer{} = LowestSetBitNZ(imm5[3:0]);

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let dst_index : integer = UInt(imm5[4:size+1]);
let src_index : integer = UInt(imm4[3:size]);
let idxdsize : integer{} = 64 << UInt(imm4[3]);
// imm4[size-1:0] is IGNORED
let esize : integer{} = 8 << size;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in “imm5”:

imm5	<Ts>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<index1> Is the destination element index encoded in “imm5”:

imm5	<index1>
x0000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])
x1000	UInt(imm5[4])

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index2> Is the source element index encoded in “(imm5 :: imm4)”:

imm5	<index2>
x0000	RESERVED
xxxx1	UInt(imm4)
xxx10	UInt(imm4[3:1])
xx100	UInt(imm4[3:2])
x1000	UInt(imm4[3])

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
let operand : bits(idxdsize) = V{idxdsize}(n);
var result : bits(128) = V{128}(d);

result[dst_index*:esize] = operand[src_index*:esize];
V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

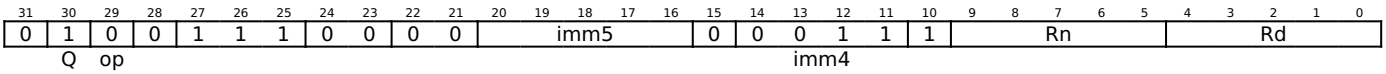
INS (general)

Insert vector element from general-purpose register

This instruction copies the contents of the source general-purpose register to the specified vector element in the destination SIMD&FP register.
This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
This instruction is used by the alias MOV (from general).

Advanced SIMD

(FEAT_AdvSIMD)



Encoding

```
INS <Vd>.<Ts>[<index>], <R><n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if imm5 == 'x0000' then EndOfDecode(Decode_UNDEF); end;
let size : integer{} = LowestSetBitNZ(imm5[3:0]);

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let index : integer = UInt(imm5[4:size+1]);
let esize : integer{} = 8 << size;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in “imm5”:

imm5	<Ts>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<index> Is the element index encoded in “imm5”:

imm5	<index>
x0000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])
x1000	UInt(imm5[4])

<R> Is the width specifier for the general-purpose source register, encoded in “imm5”:

imm5	<R>
x0000	RESERVED
xxxx1	W
xxx10	W
xx100	W
x1000	X

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let element : bits(esize) = X{esize}(n);
var result : bits(128) = V{128}(d);

result[index*:esize] = element;
V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

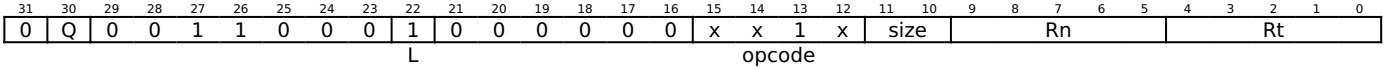
LD1 (multiple structures)

Load multiple single-element structures to one, two, three, or four registers

This instruction loads multiple single-element structures from memory and writes the result to one, two, three, or four SIMD&FP registers. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the One register variant

Applies when `(opcode == 0111)`

```
LD1 { <Vt>.<T> }, [<Xn|SP>]
```

Encoding for the Two registers variant

Applies when `(opcode == 1010)`

```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

Encoding for the Three registers variant

Applies when `(opcode == 0110)`

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

Encoding for the Four registers variant

Applies when `(opcode == 0010)`

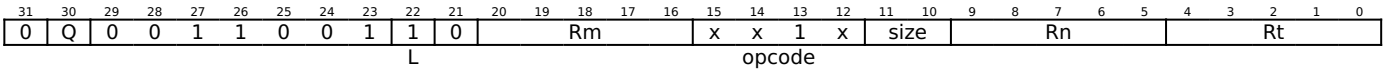
```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the One register, immediate offset variant

Applies when `(Rm == 11111 && opcode == 0111)`

```
LD1 { <Vt>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the One register, register offset variant

Applies when `(Rm != 11111 && opcode == 0111)`

```
LD1 { <Vt>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Two registers, immediate offset variant

Applies when `(Rm == 11111 && opcode == 1010)`

```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Two registers, register offset variant

Applies when `(Rm != 11111 && opcode == 1010)`

```
LD1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Three registers, immediate offset variant

Applies when `(Rm == 11111 && opcode == 0110)`

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Three registers, register offset variant

Applies when `(Rm != 11111 && opcode == 0110)`

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Four registers, immediate offset variant

Applies when `(Rm == 11111 && opcode == 0010)`

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Four registers, register offset variant

Applies when `(Rm != 11111 && opcode == 0010)`

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<imm> For the "One register, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#8
1	#16

For the "Two registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#16
1	#32

For the "Three registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#24
1	#48

For the "Four registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#32
1	#64

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

var rpt : integer;                // number of iterations
let selem : integer = 1;          // structure elements

case opcode of
    when '0010' => rpt = 4;    // LD/ST1 (4 registers)
    when '0110' => rpt = 3;    // LD/ST1 (3 registers)
    when '1010' => rpt = 2;    // LD/ST1 (2 registers)
    when '0111' => rpt = 1;    // LD/ST1 (1 register)
    otherwise => EndOfDecode(Decode_UNDEF);
end;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var address : bits(64);
var eaddr : bits(64);
var rval : bits(datasize);
var tt : integer;
var offs : bits(64) = Zeros{};
let ebytes : integer{} = esize DIV 8;

let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_LOAD, nontemporal,
                                                    tagchecked, privileged);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

for r = 0 to rpt - 1 do
    for e = 0 to elements - 1 do
        tt = (t + r) MOD 32;
        for s = 0 to selem - 1 do
            rval = V{datasize}(tt);
            eaddr = AddressIncrement(address, offs, accdesc);
            rval[e *: esize] = Mem{esize}(eaddr, accdesc);
            V{datasize}(tt) = rval;
            offs = offs + ebytes;
            tt = (tt + 1) MOD 32;
        end;
    end;
end;

LD1 (single structure)

Load one single-element structure to one lane of one register

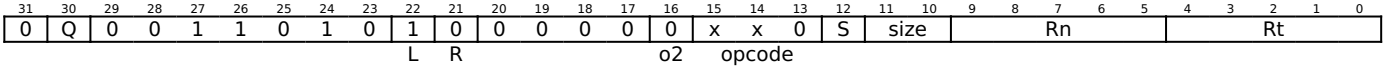
This instruction loads a single-element structure from memory and writes the result to the specified lane of the SIMD&FP register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when `(opcode == 000)`

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when `(opcode == 010 && size == x0)`

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when `(opcode == 100 && size == 00)`

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when `(opcode == 100 && S == 0 && size == 01)`

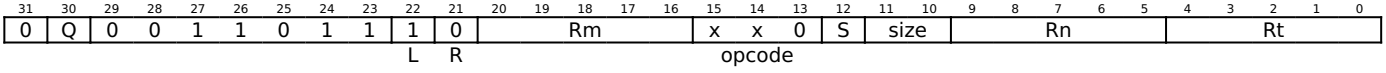
```
LD1 { <Vt>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 000)`

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>], #1
```

Encoding for the 8-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 000)`

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && S == 0 && size == 01)`

```
LD1 { <Vt>.D }[<index>], [<Xn|SP>], #8
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && S == 0 && size == 01)`

```
LD1 { <Vt>.D }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 010 && size == x0)`

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>], #2
```

Encoding for the 16-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 010 && size == x0)`

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && size == 00)`

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>], #4
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && size == 00)`

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

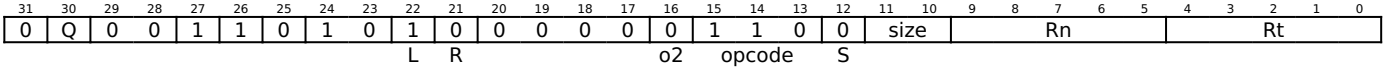
LD1R

Load one single-element structure and replicate to all lanes (of one register)

This instruction loads a single-element structure from memory and replicates the structure to all the lanes of the SIMD&FP register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

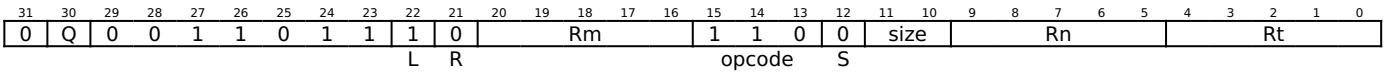
```
LD1R { <Vt>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD1R { <Vt>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD1R { <Vt>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “size”:

size	<imm>
00	#1
01	#2
10	#4
11	#8

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

case scale of
    when '11' =>
        // load and replicate
        if L == '0' || S == '1' then EndOfDecode(Decode_UNDEF); end;
        scale = size;
        replicate = TRUE;
    when '00' =>
        index = UInt(Q::S::size);     // B[0-15]
    when '01' =>

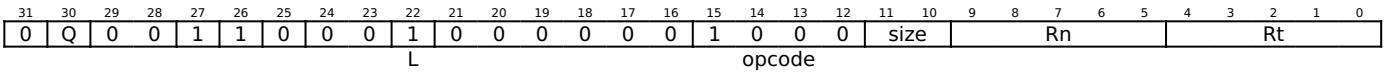
LD2 (multiple structures)

Load multiple 2-element structures to two registers

This instruction loads multiple 2-element structures from memory and writes the result to the two SIMD&FP registers, with de-interleaving. For an example of de-interleaving, see *LD3 (multiple structures)*.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

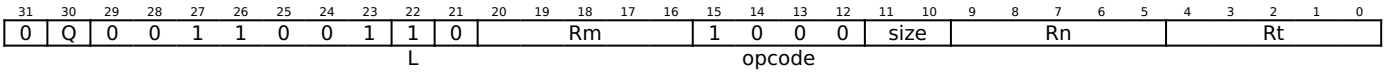
```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#16
1	#32

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

let rpt : integer = 1;                  // number of iterations

LD2 (single structure)

Load single 2-element structure to one lane of two registers

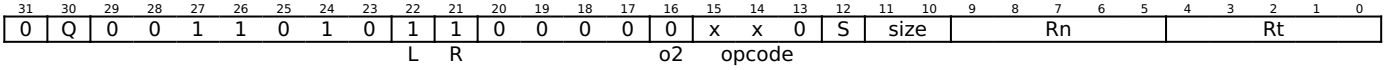
This instruction loads a 2-element structure from memory and writes the result to the corresponding elements of the two SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when `(opcode == 000)`

```
LD2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when `(opcode == 010 && size == x0)`

```
LD2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when `(opcode == 100 && size == 00)`

```
LD2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when `(opcode == 100 && S == 0 && size == 01)`

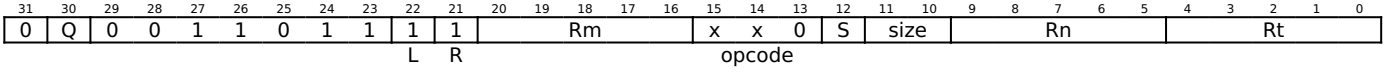
```
LD2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 000)`

```
LD2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>], #2
```

Encoding for the 8-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 000)`

```
LD2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 010 && size == x0)`

```
LD2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>], #4
```

Encoding for the 16-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 010 && size == x0)`

```
LD2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && size == 00)`

```
LD2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>], #8
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && size == 00)`

```
LD2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && S == 0 && size == 01)`

```
LD2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>], #16
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && S == 0 && size == 01)`

```
LD2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```

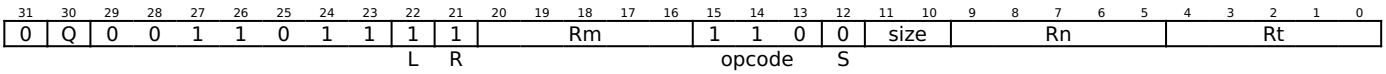
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “size”:

size	<imm>
00	#2
01	#4
10	#8
11	#16

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

case scale of
    when '11' =>
        // load and replicate
        if L == '0' || S == '1' then EndOfDecode(Decode_UNDEF); end;
        scale = size;
        replicate = TRUE;
    when '00' =>
        index = UInt(Q::S::size);     // B[0-15]
    when '01' =>
        if size[0] == '1' then EndOfDecode(Decode_UNDEF); end;
        index = UInt(Q::S::size[1]);  // H[0-7]
    when '10' =>
        if size[1] == '1' then EndOfDecode(Decode_UNDEF); end;
        if size[0] == '0' then
            index = UInt(Q::S);       // S[0-3]
        else
            if S == '1' then EndOfDecode(Decode_UNDEF); end;
            index = UInt(Q);          // D[0-1]
            scale = '11';
        end;
end;

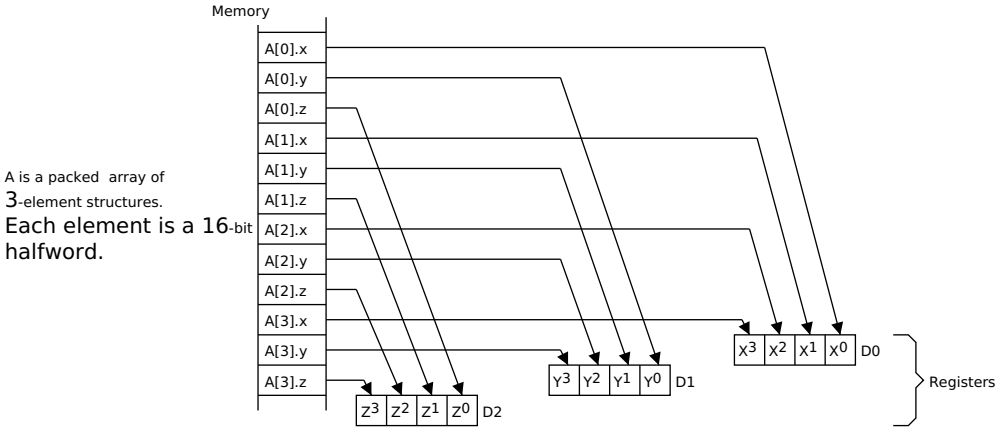
LD3 (multiple structures)

Load multiple 3-element structures to three registers

This instruction loads multiple 3-element structures from memory and writes the result to the three SIMD&FP registers, with de-interleaving. The following figure shows an example of the operation of de-interleaving of an LD3.16 (multiple 3-element structures) instruction.

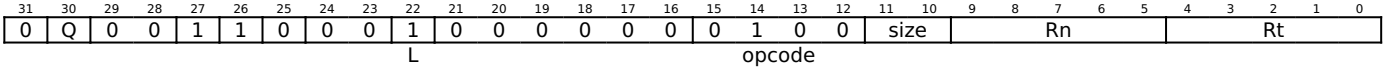


Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

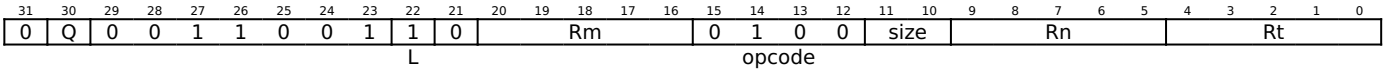
```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#24
1	#48

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

let rpt : integer = 1;                // number of iterations

LD3 (single structure)

Load single 3-element structure to one lane of three registers

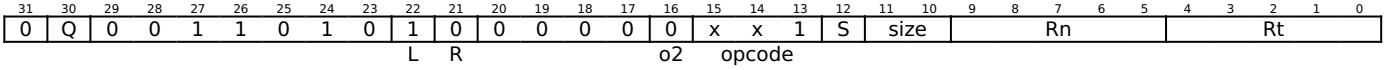
This instruction loads a 3-element structure from memory and writes the result to the corresponding elements of the three SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when `(opcode == 001)`

```
LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when `(opcode == 011 && size == x0)`

```
LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when `(opcode == 101 && size == 00)`

```
LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when `(opcode == 101 && S == 0 && size == 01)`

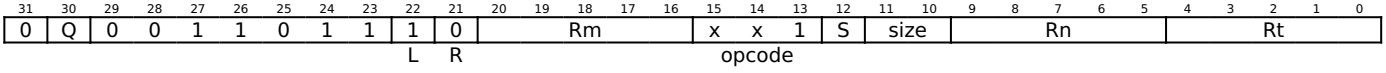
```
LD3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 001)`

```
LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>], #3
```

Encoding for the 8-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 001)`

```
LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 011 && size == x0)`

```
LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>], #6
```

Encoding for the 16-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 011 && size == x0)`

```
LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && size == 00)`

```
LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>], #12
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && size == 00)`

```
LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && S == 0 && size == 01)`

```
LD3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>], #24
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && S == 0 && size == 01)`

```
LD3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3>	Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

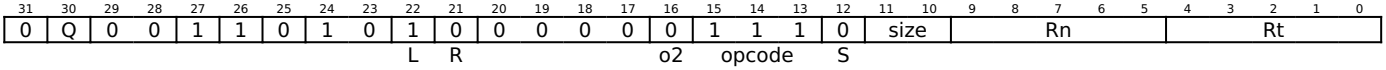
LD3R

Load single 3-element structure and replicate to all lanes of three registers

This instruction loads a 3-element structure from memory and replicates the structure to all the lanes of the three SIMD&FP registers.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

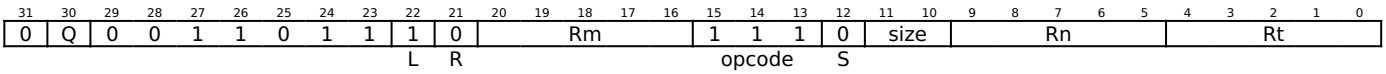
```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “size”:

size	<imm>
00	#3
01	#6
10	#12
11	#24

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

case scale of
    when '11' =>

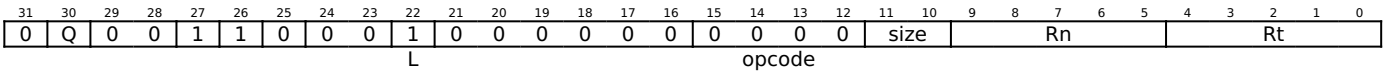
LD4 (multiple structures)

Load multiple 4-element structures to four registers

This instruction loads multiple 4-element structures from memory and writes the result to the four SIMD&FP registers, with de-interleaving. For an example of de-interleaving, see *LD3 (multiple structures)*.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

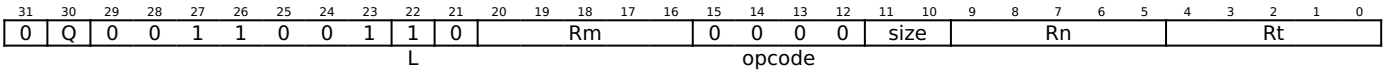
```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#32
1	#64

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

let rpt : integer = 1;                 // number of iterations
let selem : integer = 4;           // structure elements

// .1D format only permitted with LD1 & ST1
if size::Q == '110' && selem != 1 then EndOfDecode(Decode_UNDEF); end;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var address : bits(64);
var eaddr : bits(64);
var rval : bits(datasize);
var tt : integer;
var offs : bits(64) = Zeros{};
let ebytes : integer{} = esize DIV 8;

LD4 (single structure)

Load single 4-element structure to one lane of four registers

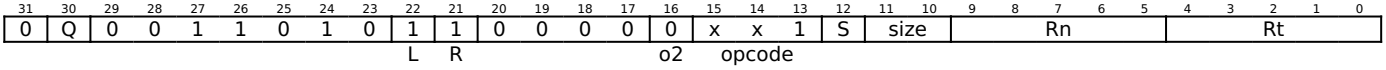
This instruction loads a 4-element structure from memory and writes the result to the corresponding elements of the four SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when `(opcode == 001)`

```
LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when `(opcode == 011 && size == x0)`

```
LD4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when `(opcode == 101 && size == 00)`

```
LD4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when `(opcode == 101 && S == 0 && size == 01)`

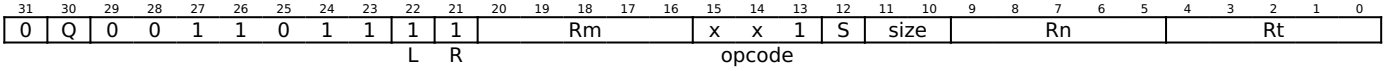
```
LD4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 001)`

```
LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], #4
```

Encoding for the 8-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 001)`

```
LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 011 && size == x0)`

```
LD4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], #8
```

Encoding for the 16-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 011 && size == x0)`

```
LD4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && size == 00)`

```
LD4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], #16
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && size == 00)`

```
LD4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && S == 0 && size == 01)`

```
LD4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], #32
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && S == 0 && size == 01)`

```
LD4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3>	Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

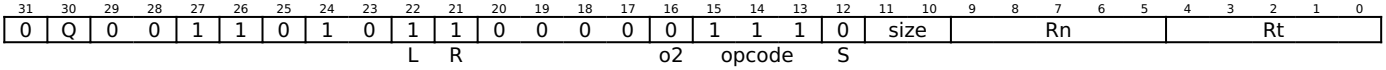
LD4R

Load single 4-element structure and replicate to all lanes of four registers

This instruction loads a 4-element structure from memory and replicates the structure to all the lanes of the four SIMD&FP registers.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

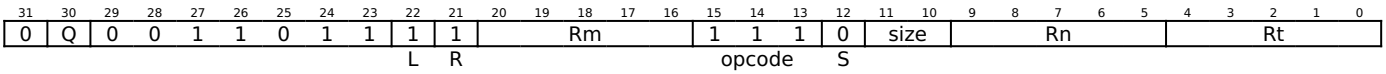
```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “size”:

size	<imm>
00	#4
01	#8
10	#16
11	#32

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

LDAP1 (SIMD&FP)

Load-acquire RCpc one single-element structure to one lane of one register

This instruction loads a single-element structure from memory and writes the result to the specified lane of the SIMD&FP register without affecting the other bits of the register.

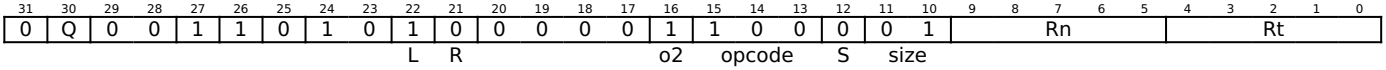
The instruction has memory ordering semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release*.

For information about addressing modes, see *Load/Store addressing modes*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

64-bit

(FEAT_AdvSIMD && FEAT_LRCPC3)



Encoding

```
LDAP1 { <Vt>.D }[<index>], [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_LRCPC3) then
    EndOfDecode(Decode_UNDEF);
end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<index>	Is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Shared Decode

LDAPUR (SIMD&FP)

Load-acquire RCpc SIMD&FP register (unscaled offset)

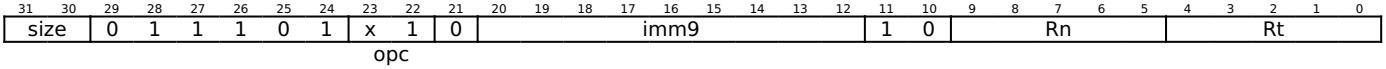
This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

The instruction has memory ordering semantics as described in *Load-Acquire, Load-AcquirePC, and Store-Release*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Unscaled offset

(FEAT_FP && FEAT_LRCPC3)



Encoding for the 8-bit variant

Applies when `(size == 00 && opc == 01)`

```
LDAPUR <Bt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 01)`

```
LDAPUR <Ht>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 01)`

```
LDAPUR <St>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 01)`

```
LDAPUR <Dt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 11)`

```
LDAPUR <Qt>, [<Xn|SP>{, #<simm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LRCPC3) then
    EndOfDecode(Decode_UNDEF);
end;
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let offset : bits(64) = SignExtend{}(imm9);
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm>	Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<St>	Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt>	Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 8 << scale;
let tagchecked : boolean = n != 31;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
var address : bits(64);
let accdesc : AccessDescriptor = CreateAccDescASIMDAcqRel(MemOp_LOAD, tagchecked);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

V{datasize}(t) = Mem{datasize}(address, accdesc);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LDBFADD, LDBFADDA, LDBFADDAL, LDBFADDL

Atomic BFloat16 add

This instruction atomically loads a 16-bit value from memory, adds it to the BFloat16 value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDBFADDA` and `LDBFADDAL` load from memory with acquire semantics.
- `LDBFADDL` and `LDBFADDAL` store to memory with release semantics.
- `LDBFADD` has neither acquire nor release semantics.

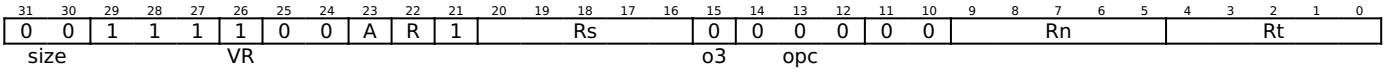
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(A == 0 && R == 0)`

```
LDBFADD <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire variant

Applies when `(A == 1 && R == 0)`

```
LDBFADDA <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire-release variant

Applies when `(A == 1 && R == 1)`

```
LDBFADDAL <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(A == 0 && R == 1)`

```
LDBFADDL <Hs>, <Ht>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = A == '1';
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFADD, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);

V{datasize}(t) = data;
```

LDBFMAX, LDBFMAXA, LDBFMAXAL, LDBFMAXL

Atomic BFloat16 maximum

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 maximum with the value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDBFMAXA` and `LDBFMAXAL` load from memory with acquire semantics.
- `LDBFMAXL` and `LDBFMAXAL` store to memory with release semantics.
- `LDBFMAX` has neither acquire nor release semantics.

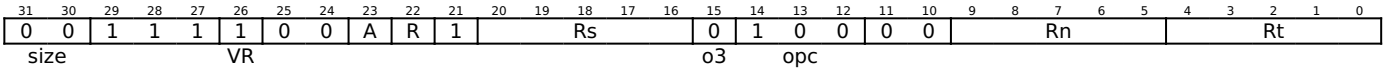
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(A == 0 && R == 0)`

```
LDBFMAX <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire variant

Applies when `(A == 1 && R == 0)`

```
LDBFMAXA <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire-release variant

Applies when `(A == 1 && R == 1)`

```
LDBFMAXAL <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(A == 0 && R == 1)`

```
LDBFMAXL <Hs>, <Ht>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = A == '1';
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMAX, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);

V{datasize}(t) = data;
```

LDBFMAXNM, LDBFMAXNMA, LDBFMAXNMAL, LDBFMAXNML

Atomic BFloat16 maximum number

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 maximum number with the value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDBFMAXNMA` and `LDBFMAXNMAL` load from memory with acquire semantics.
- `LDBFMAXNML` and `LDBFMAXNMAL` store to memory with release semantics.
- `LDBFMAXNM` has neither acquire nor release semantics.

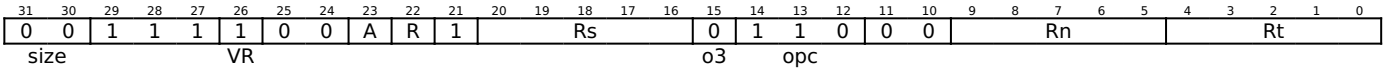
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(A == 0 && R == 0)`

```
LDBFMAXNM <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire variant

Applies when `(A == 1 && R == 0)`

```
LDBFMAXNMA <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire-release variant

Applies when `(A == 1 && R == 1)`

```
LDBFMAXNMAL <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(A == 0 && R == 1)`

```
LDBFMAXNML <Hs>, <Ht>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = A == '1';
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMAXNM, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);

V{datasize}(t) = data;
```

LDBFMIN, LDBFMINA, LDBFMINAL, LDBFMINL

Atomic BFloat16 minimum

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 minimum with the value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDBFMINA` and `LDBFMINAL` load from memory with acquire semantics.
- `LDBFMINL` and `LDBFMINAL` store to memory with release semantics.
- `LDBFMIN` has neither acquire nor release semantics.

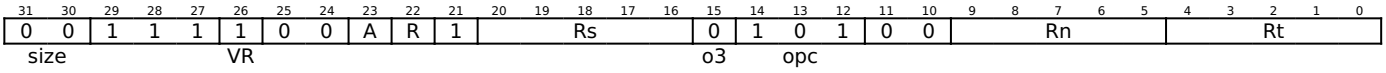
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(A == 0 && R == 0)`

```
LDBFMIN <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire variant

Applies when `(A == 1 && R == 0)`

```
LDBFMINA <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Acquire-release variant

Applies when `(A == 1 && R == 1)`

```
LDBFMINAL <Hs>, <Ht>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(A == 0 && R == 1)`

```
LDBFMINL <Hs>, <Ht>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = A == '1';
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMIN, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);

V{datasize}(t) = data;
```

LDFADD, LDFADDA, LDFADDAL, LDFADDL

Atomic floating-point add

This instruction atomically loads a 16-bit, 32-bit, or 64-bit value from memory, performs a floating-point add with the value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDFADDA` and `LDFADDAL` load from memory with acquire semantics.
- `LDFADDL` and `LDFADDAL` store to memory with release semantics.
- `LDFADD` has neither acquire nor release semantics.

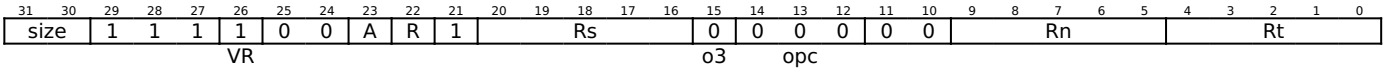
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the Half-precision no memory ordering variant

Applies when `(size == 01 && A == 0 && R == 0)`

```
LDFADD <Hs>, <Ht>, [<Xn|SP>]

LDFMAX, LDFMAXA, LDFMAXAL, LDFMAXL

Atomic floating-point maximum

This instruction atomically loads a 16-bit, 32-bit, or 64-bit value from memory, calculates the floating-point maximum with the value held in a register, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- `LDFMAXA` and `LDFMAXAL` load from memory with acquire semantics.
- `LDFMAXL` and `LDFMAXAL` store to memory with release semantics.
- `LDFMAX` has neither acquire nor release semantics.

This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

LDNP (SIMD&FP)

Load pair of SIMD&FP registers, with non-temporal hint

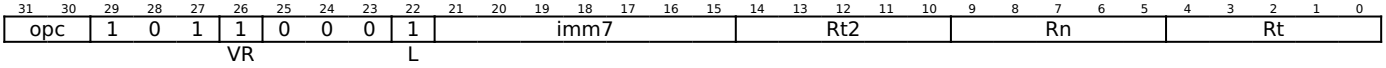
This instruction loads a pair of SIMD&FP registers from memory, issuing a hint to the memory system that the access is non-temporal. The address that is used for the load is calculated from a base register value and an optional immediate offset.

For information about non-temporal pair instructions, see *Load/Store SIMD and Floating-point non-temporal pair*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Signed offset

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
LDNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
LDNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
LDNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for all variants of this encoding

```
// Empty.
```

Assembler Symbols

<St1>	Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<St2>	Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "32-bit" variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4. For the "64-bit" variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8. For the "128-bit" variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.
<Dt1>	Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt2>	Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.

Shared Decode

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
let t : integer{} = UInt(Rt);
let t2 : integer{} = UInt(Rt2);
let n : integer{} = UInt(Rn);
let nontemporal : boolean = TRUE;

LDP (SIMD&FP)

Load pair of SIMD&FP registers

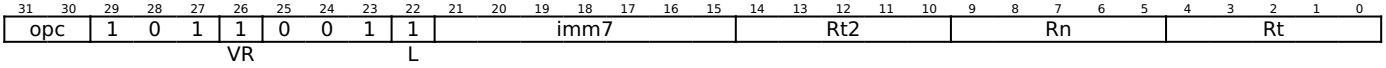
This instruction loads a pair of SIMD&FP registers from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: Post-index , Pre-index and Signed offset

Post-index

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
LDP <St1>, <St2>, [<Xn|SP>], #<imm>
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
LDP <Dt1>, <Dt2>, [<Xn|SP>], #<imm>
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
LDP <Qt1>, <Qt2>, [<Xn|SP>], #<imm>
```

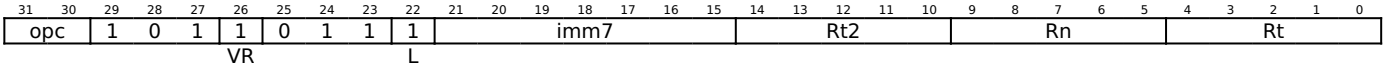
Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = TRUE;
let postindex : boolean = TRUE;
```

Pre-index

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
LDP <St1>, <St2>, [<Xn|SP>, #<imm>]!
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
LDP <Dt1>, <Dt2>, [<Xn|SP>, #<imm>]!
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
LDP <Qt1>, <Qt2>, [<Xn|SP>, #<imm>]!
```

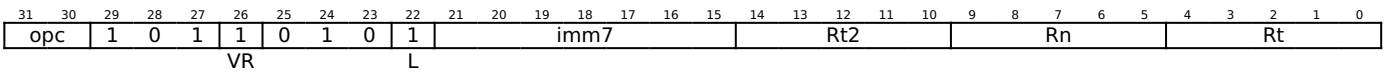
Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = TRUE;
let postindex : boolean = FALSE;
```

Signed offset

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
LDP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
LDP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
LDP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = FALSE;
let postindex : boolean = FALSE;
```

LDR (immediate, SIMD&FP)

Load SIMD&FP register (immediate offset)

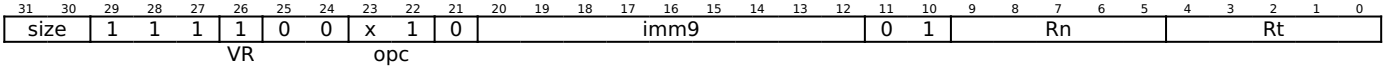
This instruction loads an element from memory, and writes the result as a scalar to the SIMD&FP register. The address that is used for the load is calculated from a base register value, a signed immediate offset, and an optional offset that is a multiple of the element size.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: Post-index , Pre-index and Unsigned offset

Post-index

(FEAT_FP)



Encoding for the 8-bit variant

Applies when `(size == 00 && opc == 01)`

```
LDR <Bt>, [<Xn|SP>], #<simm>
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 01)`

```

LDR (literal, SIMD&FP)

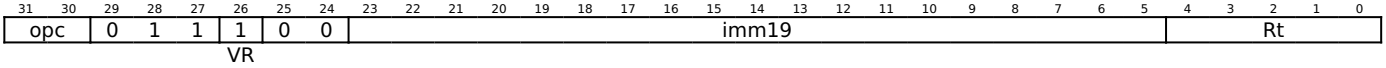
Load SIMD&FP register (PC-relative literal)

This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from the PC value and an immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Literal

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
LDR <St>, <label>
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
LDR <Dt>, <label>
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
LDR <Qt>, <label>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
let t : integer{} = UInt(Rt);
if opc == '11' then EndOfDecode(Decode_UNDEF); end;
let size : integer{} = 4 << (UInt(opc) as integer{0..2});
let nontemporal : boolean = FALSE;
let tagchecked : boolean = FALSE;

let offset : bits(64) = SignExtend{}(imm19::'00');
```

Assembler Symbols

<St>	Is the 32-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<label>	Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.
<Dt>	Is the 64-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
<Qt>	Is the 128-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.

Operation

```
let address : bits(64) = PC64() + offset;
AArch64_CheckFPEnabled();
let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_LOAD, nontemporal,
                                                    tagchecked, privileged);
let data : bits(size*8) = Mem{size*8}(address, accdesc);
V{size*8}(t) = data;
```

LDR (register, SIMD&FP)

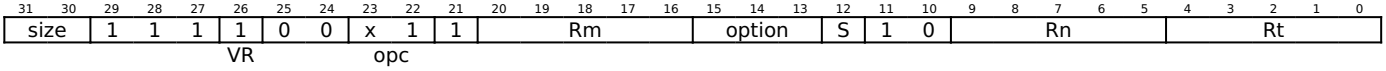
Load SIMD&FP register (register offset)

This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SIMD&FP registers

(FEAT_FP)



Encoding for the 8-bit with extended register offset variant

Applies when `(size == 00 && opc == 01 && option != 011)`

```
LDR <Bt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

Encoding for the 8-bit with shifted register offset variant

Applies when `(size == 00 && opc == 01 && option == 011)`

```
LDR <Bt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 01)`

```
LDR <Ht>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 01)`

```
LDR <St>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 01)`

```
LDR <Dt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 11)`

```
LDR <Qt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if option[1] == '0' then EndOfDecode(Decode_UNDEF); end;          // sub-word index
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let extend_type : ExtendType = DecodeRegExtend(option);
let shift : integer{} = if S == '1' then scale else 0;
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Wm>	When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
<Xm>	When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
<extend>	For the "8-bit with extended register offset" variant: is the index extend specifier, encoded in “option”:

option	<extend>
010	UXTW
110	SXTW
111	SXTX

For the "128-bit", "16-bit", "32-bit", and "64-bit" variants: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted, encoded in “option”:

option	<extend>
010	UXTW
011	LSL
110	SXTW
111	SXTX

<amount> For the "8-bit with extended register offset" and "8-bit with shifted register offset" variants: is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

For the "16-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#1

For the "32-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#2

For the "64-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#3

For the "128-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#4

<Ht> Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<St> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Dt> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Qt> Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 8 << scale;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = TRUE;
```

Operation

```
AArch64_CheckFPEnabled();
let offset : bits(64) = ExtendReg{}(m, extend_type, shift);
var address : bits(64);

let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_LOAD, nontemporal, tagchecked,
                                                    privileged);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

V{datasize}(t) = Mem{datasize}(address, accdesc);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LDTNP (SIMD&FP)

Load unprivileged pair of SIMD&FP registers, with non-temporal hint

This instruction loads a pair of SIMD&FP registers from memory, issuing a hint to the memory system that the access is non-temporal. The address that is used for the load is calculated from a base register value and an optional immediate offset. For information about non-temporal pair instructions, see *Load/Store SIMD and Floating-point non-temporal pair*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

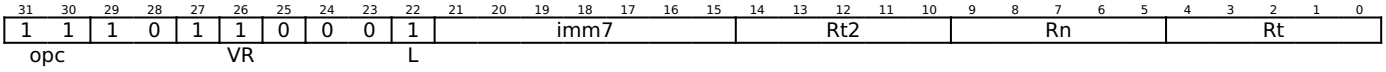
Explicit Memory effects produced by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of *HCR_EL2()*.{E2H, TGE} is '11'.

Otherwise, the Explicit Memory effects operate with the restrictions determined by the Exception level at which the instruction is executed.

Signed offset

(FEAT_FP && FEAT_LSUI)



Encoding

```
LDTNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer{} = UInt(Rt);
let t2 : integer{} = UInt(Rt2);
let n : integer{} = UInt(Rn);
let nontemporal : boolean = TRUE;
let datasize : integer{} = 128;
let offset : bits(64) = LSL(SignExtend{64}(imm7), 4);
let tagchecked : boolean = n != 31;

var rt_unknown : boolean = FALSE;
if t == t2 then
    let c : Constraint = ConstrainUnpredictable(Unpredictable_LDPOVERLAP);
    assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN =>     rt_unknown = TRUE;     // Result is UNKNOWN
        when Constraint_UNDEF =>       EndOfDecode(Decode_UNDEF);
        when Constraint_NOP =>         EndOfDecode(Decode_NOP);
    end;
end;
```

`LDTNP (SIMD&FP)` has the same CONSTRAINED UNPREDICTABLE behavior as `LDNP (SIMD&FP)`. For information about this CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDNP (SIMD&FP)*.

Assembler Symbols

<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);

let privileged : boolean = AArch64_IsUnprivAccessPriv();
let ispair : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_LOAD, nontemporal, tagchecked,
                                                    privileged, ispair);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

let data : bits(2*datasize) = Mem{2*datasize}(address, accdesc);
if rt_unknown then
    V{datasize}(t) = ARBITRARY : bits(datasize);
elsif BigEndian(accdesc.acctype) then
    V{datasize}(t2) = data[(datasize-1):0];
    V{datasize}(t)  = data[(2*datasize-1):datasize];
else
    V{datasize}(t)  = data[(datasize-1):0];
    V{datasize}(t2) = data[(2*datasize-1):datasize];
end;
```

Operational information

LDTP (SIMD&FP)

Load unprivileged pair of SIMD&FP registers

This instruction loads a pair of SIMD&FP registers from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Explicit Memory effects produced by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

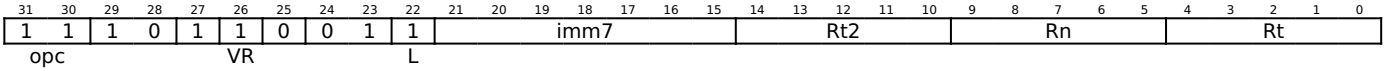
- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of *HCR_EL2()*.{E2H, TGE} is '11'.

Otherwise, the Explicit Memory effects operate with the restrictions determined by the Exception level at which the instruction is executed.

It has encodings from 3 classes: Post-index , Pre-index and Signed offset

Post-index

(FEAT_FP && FEAT_LSUI)



Encoding

```
LDTP <Qt1>, <Qt2>, [<Xn|SP>], #<imm>
```

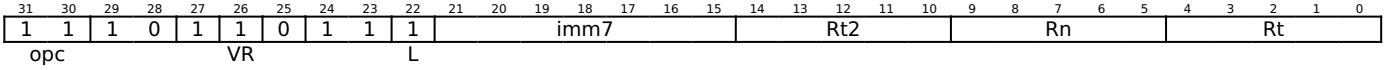
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = TRUE;
let postindex : boolean = TRUE;
```

Pre-index

(FEAT_FP && FEAT_LSUI)



Encoding

```
LDTP <Qt1>, <Qt2>, [<Xn|SP>, #<imm>]!
```

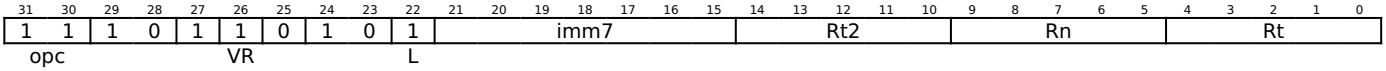
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = TRUE;
let postindex : boolean = FALSE;
```

Signed offset

(FEAT_FP && FEAT_LSUI)



Encoding

```
LDTP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = FALSE;
let postindex : boolean = FALSE;
```

LDTP has the same CONSTRAINED UNPREDICTABLE behavior as LDP (SIMD&FP). For information about this CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDP (SIMD&FP)*.

Assembler Symbols

<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Post-index" and "Pre-index" variants: is the signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, encoded in the "imm7" field as <imm>/16. For the "Signed offset" variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Shared Decode

```
let t : integer{} = UInt(Rt);
let t2 : integer{} = UInt(Rt2);
let n : integer{} = UInt(Rn);
let nontemporal : boolean = FALSE;
let datasize : integer{} = 128;
let offset : bits(64) = LSL(SignExtend{64}(imm7), 4);
let tagchecked : boolean = wback || n != 31;

var rt_unknown : boolean = FALSE;

LDUR (SIMD&FP)

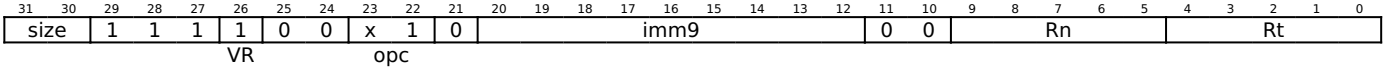
Load SIMD&FP register (unscaled offset)

This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Unscaled offset

(FEAT_FP)



Encoding for the 8-bit variant

Applies when `(size == 00 && opc == 01)`

```
LDUR <Bt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 01)`

```
LDUR <Ht>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 01)`

```
LDUR <St>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 01)`

```
LDUR <Dt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 11)`

```
LDUR <Qt>, [<Xn|SP>{, #<simm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let offset : bits(64) = SignExtend{}(imm9);
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm>	Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<St>	Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt>	Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 8 << scale;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
```

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_LOAD, nontemporal,
                                                    tagchecked, privileged);

if n == 31 then
    CheckSPAlignment();

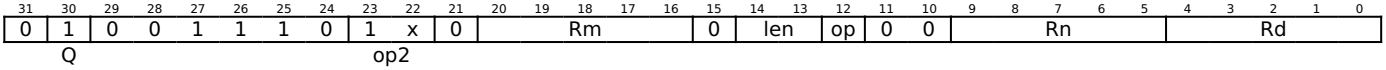
LUTI2

Lookup table read with 2-bit indices

This instruction copies indexed 8-bit or 16-bit elements from the table vector to the destination vector using packed 2-bit indices from a segment of the source vector. A segment corresponds to a portion of the source vector that is consumed in order to fill the destination vector. The segment is selected by the vector segment index.

Advanced SIMD

(FEAT_AdvSIMD && FEAT_LUT)



Encoding for the Byte variant

Applies when `(op2 == 10 && op == 1)`

```
LUTI2 <Vd>.16B, { <Vn>.16B }, <Vm>[<index>]
```

Encoding for the Halfword variant

Applies when `(op2 == 11)`

```
LUTI2 <Vd>.8H, { <Vn>.8H }, <Vm>[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_LUT) then
    EndOfDecode(Decode_UNDEF);
end;
if op2 == '10' && op == '0' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let isize : integer{} = 2;
let esize : integer{} = if op2 == '10' then 8 else 16;
let part : integer = if op2 == '10' then UInt(len) else UInt(len::op);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn>	Is the name of the SIMD&FP table register, encoded in the "Rn" field.
<Vm>	Is the name of the SIMD&FP source register, encoded in the "Rm" field.
<index>	For the "Byte" variant: is the vector segment index, in the range 0 to 3, encoded in the "len" field. For the "Halfword" variant: is the vector segment index, in the range 0 to 7, encoded in the "len:op" fields.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let elements : integer = 128 DIV esize;
let ibase : integer = elements * part;
let indices : bits(128) = V{128}(m);
let table : bits(128)   = V{128}(n);
var result : bits(128);

for e = 0 to elements-1 do
    let index : integer = UInt(indices[(ibase + e)*:isize]);
    result[e*:esize] = table[index*:esize];
end;

V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

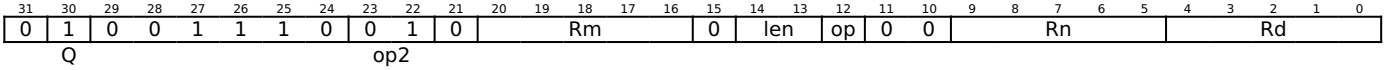
LUTI4

Lookup table read with 4-bit indices

This instruction copies indexed 8-bit or 16-bit elements from the one or two table vectors to the destination vector using packed 4-bit indices from a segment of the source vector. A segment corresponds to a portion of the source vector that is consumed in order to fill the destination vector. The segment is selected by the vector segment index.

Advanced SIMD

(FEAT_AdvSIMD && FEAT_LUT)



Encoding for the Byte variant

Applies when `(len == x1 && op == 0)`

```
LUTI4 <Vd>.16B, { <Vn>.16B }, <Vm>[<index>]
```

Encoding for the Halfword variant

Applies when `(op == 1)`

```
LUTI4 <Vd>.8H, { <Vn1>.8H, <Vn2>.8H }, <Vm>[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_LUT) then
    EndOfDecode(Decode_UNDEF);
end;
if len[0] == '0' && op == '0' then EndOfDecode(Decode_UNDEF); end;

MLA (by element)

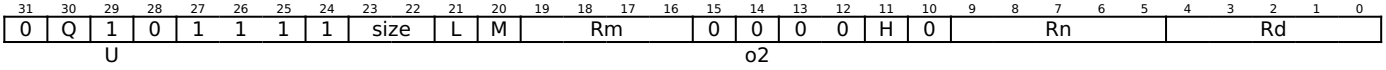
Multiply-add to accumulator (vector, by element)

This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
MLA <Vd>.<T>, <Vn>.<T>, V<m>.<Ts>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let idxdsize : integer{} = 64 << UInt(H);
var index : integer;
var Rmhi : bit;
case size of
    when '01' => index = UInt(H::L::M); Rmhi = '0';
    when '10' => index = UInt(H::L);    Rmhi = M;
    otherwise => EndOfDecode(Decode_UNDEF);
end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let m : integer = UInt(Rmhi::Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	x	RESERVED
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in “(size :: M :: Rm)”:

size	<m>
00	RESERVED
01	UInt('0' :: Rm)
10	UInt(M :: Rm)
11	RESERVED

Restricted to 0-15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in “size”:

size	<Ts>
00	RESERVED
01	H
10	S
11	RESERVED

<index> Is the element index, encoded in “(size :: H :: L :: M)”:

size	<index>
00	RESERVED
01	UInt(H :: L :: M)
10	UInt(H :: L)
11	RESERVED

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(idxdsize) = V{}(m);
let operand3 : bits(datasize) = V{}(d);
var result : bits(datasize);
var element1 : integer;
var element2 : integer;
var product : bits(esize);

element2 = UInt(operand2[index*:esize]);
for e = 0 to elements-1 do
    element1 = UInt(operand1[e*:esize]);
    product = (element1 * element2)[esize-1:0];
    result[e*:esize] = operand3[e*:esize] + product;
end;
V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MLS (by element)

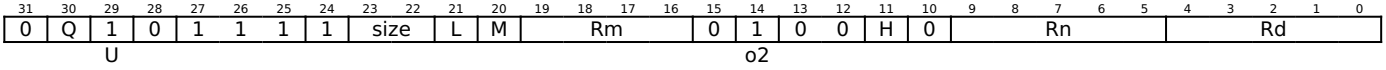
Multiply-subtract from accumulator (vector, by element)

This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and subtracts the results from the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
MLS <Vd>.<T>, <Vn>.<T>, V<m>.<Ts>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;

MOV (element)

Move vector element to another vector element

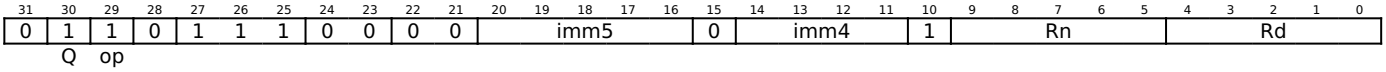
This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register. This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of INS (element). This means:

- The encodings in this description are named to match the encodings of INS (element).
- The description of INS (element) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding

```
MOV <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

is equivalent to

```
INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]
```

and is always the preferred disassembly.

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in “imm5”:

imm5	<Ts>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<index1> Is the destination element index encoded in “imm5”:

imm5	<index1>
x0000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])
x1000	UInt(imm5[4])

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index2> Is the source element index encoded in “(imm5 :: imm4)”:

imm5	<index2>
x0000	RESERVED
xxxx1	UInt(imm4)
xxx10	UInt(imm4[3:1])
xx100	UInt(imm4[3:2])
x1000	UInt(imm4[3])

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

Operation

The description of INS (element) gives the operational pseudocode for this instruction.

Operational Information

The description of INS (element) gives the operational information for this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MOV (from general)

Move general-purpose register to a vector element

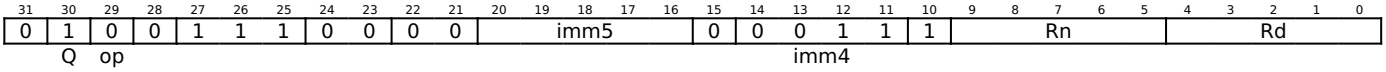
This instruction copies the contents of the source general-purpose register to the specified vector element in the destination SIMD&FP register. This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of INS (general). This means:

- The encodings in this description are named to match the encodings of INS (general).
- The description of INS (general) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding

```
MOV <Vd>.<Ts>[<index>], <R><n>
```

is equivalent to

```
INS <Vd>.<Ts>[<index>], <R><n>
```

and is always the preferred disassembly.

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in “imm5”:

imm5	<Ts>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<index> Is the element index encoded in “imm5”:

imm5	<index>
x0000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])
x1000	UInt(imm5[4])

<R> Is the width specifier for the general-purpose source register, encoded in “imm5”:

imm5	<R>
x0000	RESERVED
xxxx1	W
xxx10	W
xx100	W
x1000	X

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Operation

The description of INS (general) gives the operational pseudocode for this instruction.

Operational Information

The description of INS (general) gives the operational information for this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MOV (scalar)

Move vector element to scalar

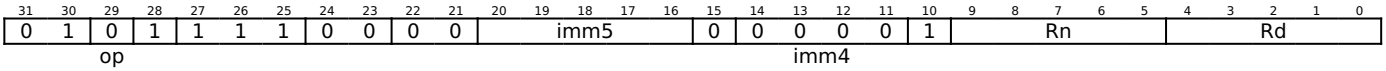
This instruction duplicates the specified vector element in the SIMD&FP source register into a scalar, and writes the result to the SIMD&FP destination register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of DUP (element). This means:

- The encodings in this description are named to match the encodings of DUP (element).
- The description of DUP (element) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Scalar

(FEAT_AdvSIMD)



Encoding

```
MOV <V><d>, <Vn>.<T>[<index>]
```

is equivalent to

```
DUP <V><d>, <Vn>.<T>[<index>]
```

and is always the preferred disassembly.

Assembler Symbols

<V> Is the destination width specifier, encoded in “imm5”:

imm5	<V>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the element width specifier, encoded in “imm5”:

imm5	<T>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

<index> Is the element index encoded in “imm5”:

imm5	<index>
x0000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])
x1000	UInt(imm5[4])

Operation

The description of DUP (element) gives the operational pseudocode for this instruction.

Operational Information

The description of DUP (element) gives the operational information for this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MOV (to general)

Move vector element to general-purpose register

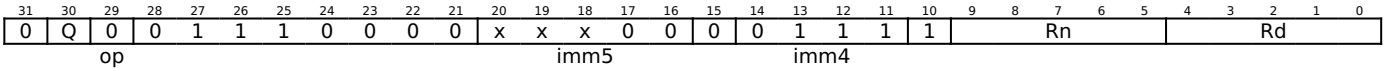
This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of UMOV. This means:

- The encodings in this description are named to match the encodings of UMOV.
- The description of UMOV gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the 32-bit variant

Applies when `(Q == 0 && imm5 == xx100)`

```
MOV <Wd>, <Vn>.S[<index>]
```

is equivalent to

```
UMOV <Wd>, <Vn>.S[<index>]
```

and is always the preferred disassembly.

Encoding for the 64-bit variant

Applies when `(Q == 1 && imm5 == x1000)`

```
MOV <Xd>, <Vn>.D[<index>]
```

is equivalent to

```
UMOV <Xd>, <Vn>.D[<index>]
```

and is always the preferred disassembly.

Assembler Symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Vn>	Is the name of the SIMD&FP source register, encoded in the "Rn" field.
<index>	For the "32-bit" variant: is the element index encoded in "imm5<4:3>". For the "64-bit" variant: is the element index encoded in "imm5<4>".
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Operation

The description of UMOV gives the operational pseudocode for this instruction.

Operational Information

The description of UMOV gives the operational information for this instruction.

MOV (vector)

Move vector

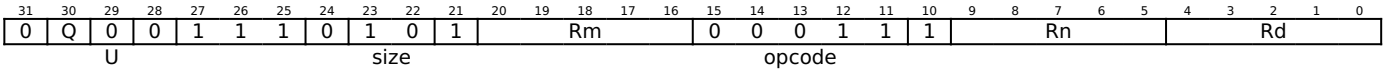
This instruction copies the vector in the source SIMD&FP register into the destination SIMD&FP register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of ORR (vector, register). This means:

- The encodings in this description are named to match the encodings of ORR (vector, register).
- The description of ORR (vector, register) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
MOV <Vd>.<T>, <Vn>.<T>
```

is equivalent to

```
ORR <Vd>.<T>, <Vn>.<T>, <Vn>.<T>
```

and is the preferred disassembly when `Rm == Rn`.

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

The description of ORR (vector, register) gives the operational pseudocode for this instruction.

Operational Information

The description of ORR (vector, register) gives the operational information for this instruction.

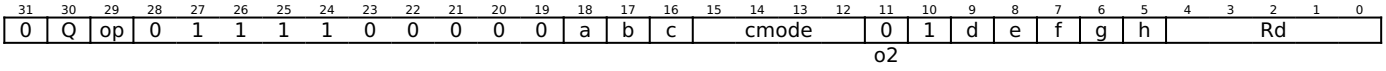
MOVI

Move immediate (vector)

This instruction places an immediate constant into every vector element of the destination SIMD&FP register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when `(op == 0 && cmode == 1110)`

```
MOVI <Vd>.<T>, #<imm8>{, LSL #0}
```

Encoding for the 16-bit shifted immediate variant

Applies when `(op == 0 && cmode == 10x0)`

```
MOVI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Encoding for the 32-bit shifted immediate variant

Applies when `(op == 0 && cmode == 0xx0)`

```
MOVI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Encoding for the 32-bit shifting ones variant

Applies when `(op == 0 && cmode == 110x)`

```
MOVI <Vd>.<T>, #<imm8>, MSL #<amount>
```

Encoding for the 64-bit scalar variant

Applies when `(Q == 0 && op == 1 && cmode == 1110)`

```
MOVI <Dd>, #<imm>
```

Encoding for the 64-bit vector variant

Applies when `(Q == 1 && op == 1 && cmode == 1110)`

```
MOVI <Vd>.2D, #<imm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let rd : integer = UInt(Rd);
let datasize : integer{} = 64 << UInt(Q);
let imm64 : bits(64) = AdvSIMDExpandImm(op, cmode, a::b::c::d::e::f::g::h);
let imm : bits(datasize) = Replicate{}(imm64);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the "8-bit" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

For the "16-bit shifted immediate" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "32-bit shifted immediate" and "32-bit shifting ones" variants: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	2S
1	4S

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the "16-bit shifted immediate" variant: is the shift amount encoded in “cmode[1]”:

cmode[1]	<amount>
0	0
1	8

defaulting to 0 if LSL is omitted.

For the "32-bit shifted immediate" variant: is the shift amount encoded in “cmode[2:1]”:

cmode[2:1]	<amount>
00	0
01	8
10	16
11	24

defaulting to 0 if LSL is omitted.

For the "32-bit shifting ones" variant: is the shift amount encoded in “cmode[0]”:

cmode[0]	<amount>
0	8
1	16

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<imm> Is a 64-bit immediate 'aaaaaaaabbbbbbbbccccccccddddddddeeeeeeeeffffffffgggggggghhhhhhhh', encoded in "a:b:c:d:e:f:g:h".

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
V{datasize}(rd) = imm;
```

MVN

Bitwise NOT (vector)

This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

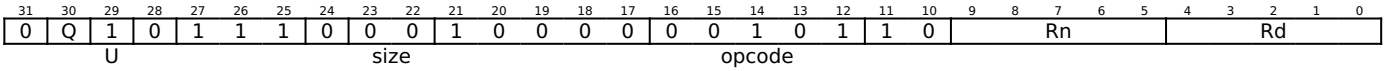
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of NOT. This means:

- The encodings in this description are named to match the encodings of NOT.
- The description of NOT gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Vector

(FEAT_AdvSIMD)



Encoding

```
MVN <Vd>.<T>, <Vn>.<T>
```

is equivalent to

```
NOT <Vd>.<T>, <Vn>.<T>
```

and is always the preferred disassembly.

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

The description of NOT gives the operational pseudocode for this instruction.

Operational Information

The description of NOT gives the operational information for this instruction.

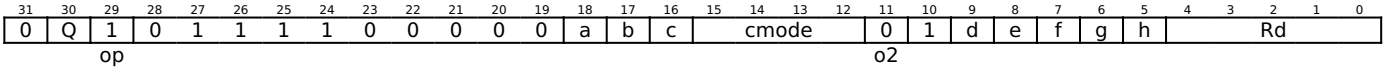
MVNI

Move inverted immediate (vector)

This instruction places the inverse of an immediate constant into every vector element of the destination SIMD&FP register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the 16-bit shifted immediate variant

Applies when `(cmode == 10x0)`

```
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Encoding for the 32-bit shifted immediate variant

Applies when `(cmode == 0xx0)`

```
MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Encoding for the 32-bit shifting ones variant

Applies when `(cmode == 110x)`

```
MVNI <Vd>.<T>, #<imm8>, MSL #<amount>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let rd : integer = UInt(Rd);
let datasize : integer{} = 64 << UInt(Q);
let imm64 : bits(64) = AdvSIMDExpandImm(op, cmode, a::b::c::d::e::f::g::h);
let imm : bits(datasize) = Replicate{}(imm64);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the "16-bit shifted immediate" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "32-bit shifted immediate" and "32-bit shifting ones" variants: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	2S
1	4S

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the "16-bit shifted immediate" variant: is the shift amount encoded in “cmode[1]”:

cmode[1]	<amount>
0	0
1	8

defaulting to 0 if LSL is omitted.

For the "32-bit shifted immediate" variant: is the shift amount encoded in “cmode[2:1]”:

cmode[2:1]	<amount>
00	0
01	8
10	16
11	24

defaulting to 0 if LSL is omitted.

For the "32-bit shifting ones" variant: is the shift amount encoded in “cmode[0]”:

cmode[0]	<amount>
0	8
1	16

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
V{datasize}(rd) = NOT(imm);
```

NEG (vector)

Negate (vector)

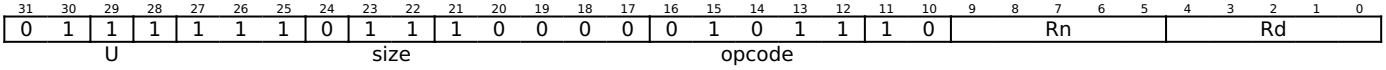
This instruction reads each vector element from the source SIMD&FP register, negates each value, puts the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
NEG D<d>, D<n>
```

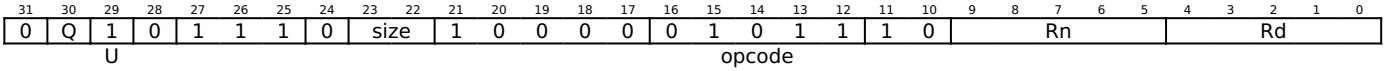
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size != '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = esize;
let elements : integer = 1;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
NEG <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size::Q == '110' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
var element : integer;

for e = 0 to elements-1 do
    element = SInt(operand[e*:esize]);
    element = -element;
    result[e*:esize] = element[esize-1:0];
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

NOT

Bitwise NOT (vector)

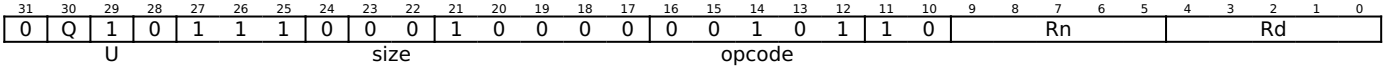
This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MVN.

Vector

(FEAT_AdvSIMD)



Encoding

```
NOT <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 8;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
var element : bits(esize);

for e = 0 to elements-1 do
    element = operand[e*:esize];
    result[e*:esize] = NOT(element);
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ORN (vector)

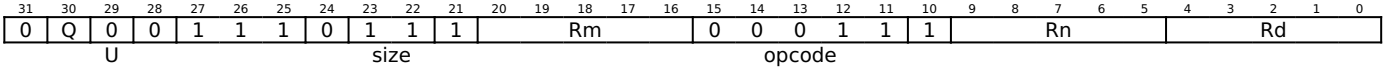
Bitwise inclusive OR NOT (vector)

This instruction performs a bitwise OR NOT between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
ORN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 64 << UInt(Q);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = NOT(V{datasize}(m));
V{datasize}(d) = operand1 OR operand2;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ORR (vector, immediate)

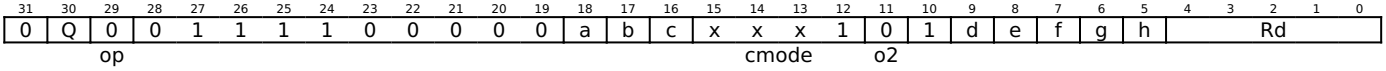
Bitwise inclusive OR (vector, immediate)

This instruction reads each vector element from the destination SIMD&FP register, performs a bitwise OR between each result and an immediate constant, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Shifted immediate

(FEAT_AdvSIMD)



Encoding for the 16-bit variant

Applies when `(cmode == 10x1)`

```
ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Encoding for the 32-bit variant

Applies when `(cmode == 0xx1)`

```
ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let rd : integer = UInt(Rd);
let datasize : integer{} = 64 << UInt(Q);
let imm64 : bits(64) = AdvSIMDExpandImm(op, cmode, a::b::c::d::e::f::g::h);
let imm : bits(datasize) = Replicate{}(imm64);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP register, encoded in the "Rd" field.

<T> For the "16-bit" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	4H
1	8H

For the "32-bit" variant: is an arrangement specifier, encoded in “Q”:

Q	<T>
0	2S
1	4S

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the "16-bit" variant: is the shift amount encoded in “cmode[1]”:

cmode[1]	<amount>
0	0
1	8

defaulting to 0 if LSL is omitted.

For the "32-bit" variant: is the shift amount encoded in “cmode[2:1]”:

cmode[2:1]	<amount>
00	0
01	8
10	16
11	24

defaulting to 0 if LSL is omitted.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(rd);
V{datasize}(rd) = operand OR imm;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

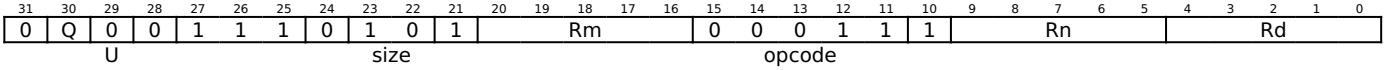
ORR (vector, register)

Bitwise inclusive OR (vector, register)

This instruction performs a bitwise OR between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
This instruction is used by the alias MOV (vector).

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
ORR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 64 << UInt(Q);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Alias Conditions

Alias	Is preferred when
MOV (vector)	`Rm == Rn`

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);
V{datasize}(d) = operand1 OR operand2;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PMUL

Polynomial multiply

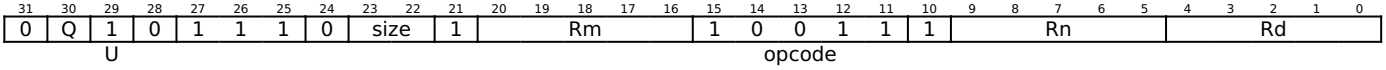
This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

For information about multiplying polynomials, see *Polynomial arithmetic over {0, 1}*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
PMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if U == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	x	RESERVED
1x	x	RESERVED

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);
var result : bits(datasize);
var element1 : bits(esize);
var element2 : bits(esize);
var product : bits(esize);

for e = 0 to elements-1 do
    element1 = operand1[e*:esize];
    element2 = operand2[e*:esize];
    product = PolynomialMult{esize, esize}(element1, element2)[esize-1:0];
    result[e*:esize] = product;
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PMULL, PMULL2

Polynomial multiply long

This instruction multiplies corresponding elements in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials, see *Polynomial arithmetic over {0, 1}*.

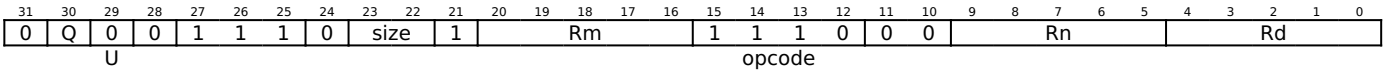
The `PMULL` instruction extracts each source vector from the lower half of each source register. The `PMULL2` instruction extracts each source vector from the upper half of each source register.

The `PMULL` and `PMULL2` variants that operate on 64-bit source elements are defined only when FEAT_PMULL is implemented.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
PMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '01' || size == '10' then EndOfDecode(Decode_UNDEF); end;
if size == '11' && !IsFeatureImplemented(FEAT_PMULL) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	RESERVED
10	RESERVED
11	1Q

The '1Q' arrangement is only allocated in an implementation that includes the Cryptographic Extension, and is otherwise RESERVED.

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	x	RESERVED
10	x	RESERVED
11	0	1D
11	1	2D

<Vm> — Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = Vpart{}(n, part);
let operand2 : bits(datasize) = Vpart{}(m, part);
var result : bits(2*datasize);
var element1 : bits(esize);
var element2 : bits(esize);

for e = 0 to elements-1 do
    element1 = operand1[e*:esize];
    element2 = operand2[e*:esize];
    result[e*:(2*esize)] = PolynomialMult{esize, esize}(element1, element2);
end;

V{2*datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RADDHN, RADDHN2

Rounding add returning high narrow

This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

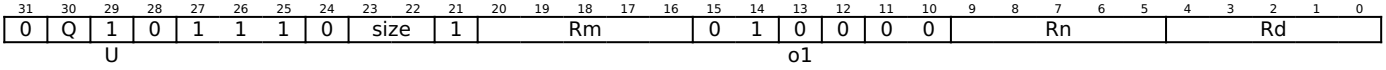
The results are rounded. For truncated results, see *ADDHN*.

The `RADDHN` instruction writes the vector to the lower half of the destination register and clears the upper half. The `RADDHN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
RADDHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
let round : boolean = TRUE;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vm> — Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(2*datasize) = V{}(n);
let operand2 : bits(2*datasize) = V{}(m);
var result : bits(datasize);
var element1 : integer;
var element2 : integer;
var sum : integer;

for e = 0 to elements-1 do
    element1 = UInt(operand1[e*:(2*esize)]);
    element2 = UInt(operand2[e*:(2*esize)]);
    sum = element1 + element2;
    sum = RShr(sum, esize, round);
    result[e*:esize] = sum[esize-1:0];
end;

Vpart{datasize}(d, part) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

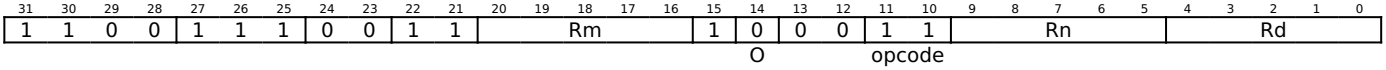
RAX1

Rotate and exclusive-OR

This instruction rotates each 64-bit element of the 128-bit vector in a source SIMD&FP register left by 1, performs a bitwise exclusive-OR of the resulting 128-bit vector and the vector in another source SIMD&FP register, and writes the result to the destination SIMD&FP register.

Advanced SIMD

(FEAT_SHA3)



Encoding

```
RAX1 <Vd>.2D, <Vn>.2D, <Vm>.2D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA3) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let Vm : bits(128) = V{}(m);
let Vn : bits(128) = V{}(n);
V{128}(d) = Vn XOR (ROL(Vm[127:64], 1)::ROL(Vm[63:0], 1));
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RBIT (vector)

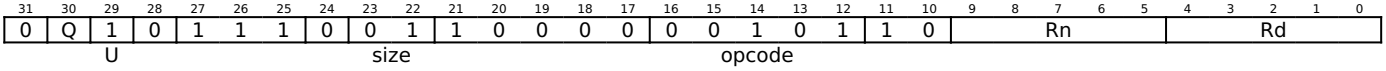
Reverse bit order (vector)

This instruction reads each vector element from the source SIMD&FP register, reverses the bits of the element, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
RBIT <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 8;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “Q”:

Q	<T>
0	8B
1	16B

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
var element : bits(esize);
var rev : bits(esize);

for e = 0 to elements-1 do
    element = operand[e*:esize];
    for i = 0 to esize-1 do
        rev[(esize-1)-i] = element[i];
    end;
    result[e*:esize] = rev;
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

REV16 (vector)

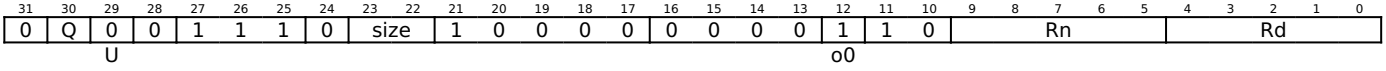
Reverse elements in 16-bit halfwords (vector)

This instruction reverses the order of 8-bit elements in each halfword of the vector in the source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
REV16 <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let csize : integer{} = 64 >> UInt(o0::U);
let esize : integer{} = 8 << UInt(size);
if csize <= esize then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 64 << UInt(Q);
let containers : integer = datasize DIV csize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	x	RESERVED
1x	x	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
for c = 0 to containers-1 do
    let container : bits(csize) = operand[c*:csize];
    result[c*:csize] = Reverse{csize}(container, esize);
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

REV32 (vector)

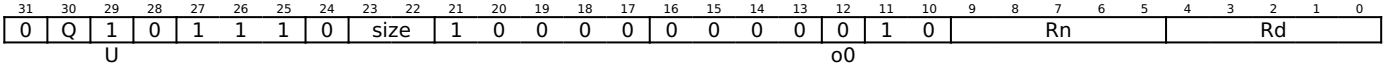
Reverse elements in 32-bit words (vector)

This instruction reverses the order of 8-bit or 16-bit elements in each word of the vector in the source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
REV32 <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let csize : integer{} = 64 >> UInt(o0::U);
let esize : integer{} = 8 << UInt(size);
if csize <= esize then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 64 << UInt(Q);
let containers : integer = datasize DIV csize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

REV64

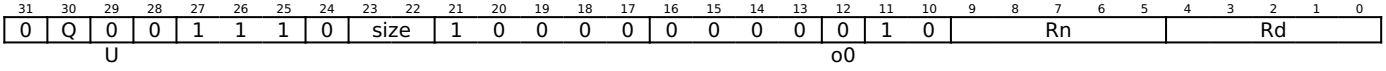
Reverse elements in 64-bit doublewords (vector)

This instruction reverses the order of 8-bit, 16-bit, or 32-bit elements in each doubleword of the vector in the source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
REV64 <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let csize : integer{} = 64 >> UInt(o0::U);
let esize : integer{} = 8 << UInt(size);
if csize <= esize then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 64 << UInt(Q);
let containers : integer = datasize DIV csize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B

RSHRN, RSHRN2

Rounding shift right narrow (immediate)

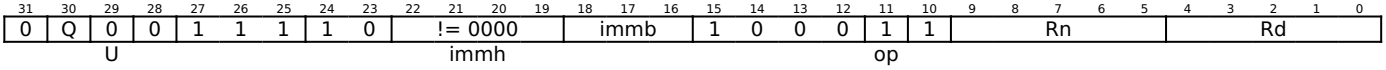
This instruction reads each unsigned integer value from the vector in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see *SHRN*.

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half. The RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
RSHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] == '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh[2:0]);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = (2 * esize) - UInt(immh::immb);
let round : boolean = TRUE;
```

Assembler Symbols

2 Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<Tb>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	x	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in “immh”:

immh	<Ta>
0001	8H
001x	4S
01xx	2D
1xxx	RESERVED

<shift> Is the right shift amount, in the range 1 to the destination element width in bits, encoded in “(immh :: immb)”:

immh	<shift>
0001	16 - UInt(immh :: immb)
001x	32 - UInt(immh :: immb)
01xx	64 - UInt(immh :: immb)
1xxx	RESERVED

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize*2) = V{}(n);
var result : bits(datasize);
var element : integer;

for e = 0 to elements-1 do
    element = RShr(UInt(operand[e*:(2*esize)]), shift, round);
    result[e*:esize] = element[esize-1:0];
end;

Vpart{datasize}(d, part) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RSUBHN, RSUBHN2

Rounding subtract returning high narrow

This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

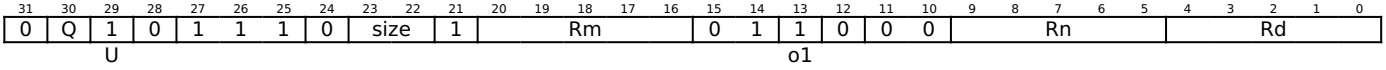
The results are rounded. For truncated results, see *SUBHN*.

The RSUBHN instruction writes the vector to the lower half of the destination register and clears the upper half. The RSUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
RSUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
let round : boolean = TRUE;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

SADALP

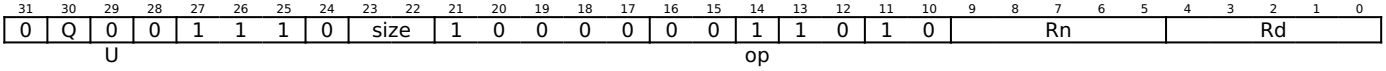
Signed add and accumulate long pairwise

This instruction adds pairs of adjacent signed integer values from the vector in the source SIMD&FP register and accumulates the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
SADALP <Vd>.<Ta>, <Vn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV (2 * esize);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

SADDL, SADDL2

Signed add long (vector)

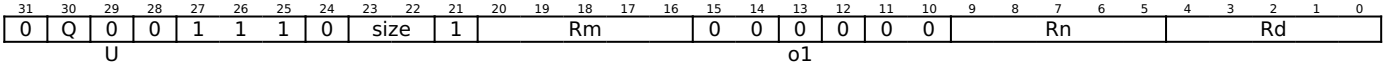
This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SADDL instruction extracts each source vector from the lower half of each source register. The SADDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
SADDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

SADDW, SADDW2

Signed add wide

This instruction adds vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the results in a vector, and writes the vector to the SIMD&FP destination register.

The SADDW instruction extracts the second source vector from the lower half of the second source register. The SADDW2 instruction extracts the second source vector from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

SCVTF (scalar SIMD&FP)

Signed integer convert to floating-point (scalar SIMD&FP)

This instruction converts the signed integer value in the SIMD&FP source register to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SCVTF (vector, fixed-point)

Signed fixed-point convert to floating-point (vector)

This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

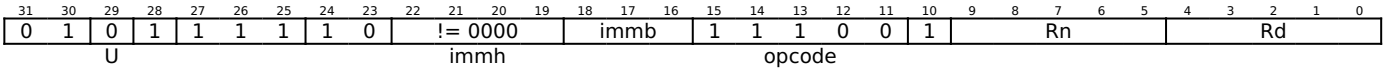
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
SCVTF <V><d>, <V><n>, #<fbits>
```

Decode for this encoding

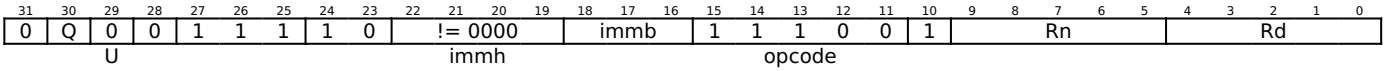
```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh IN {'000x'} || (immh IN {'001x'} && !IsFeatureImplemented(FEAT_FP16)) then
    EndOfDecode(Decode_UNDEF);
end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = if immh IN {'1xxx'} then 64 else if immh IN {'01xx'} then 32 else 16;
let datasize : integer{} = esize;
let elements : integer = 1;

let fracbits : integer = (esize * 2) - UInt(immh::immb);
let unsigned : boolean = FALSE;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
SCVTF <Vd>.<T>, <Vn>.<T>, #<fbits>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh IN {'000x'} || (immh IN {'001x'} && !IsFeatureImplemented(FEAT_FP16)) then
    EndOfDecode(Decode_UNDEF);
end;
if immh[3]::Q == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

SCVTF (vector, integer)

Signed integer convert to floating-point (vector)

This instruction converts each element in a vector from signed integer to floating-point using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

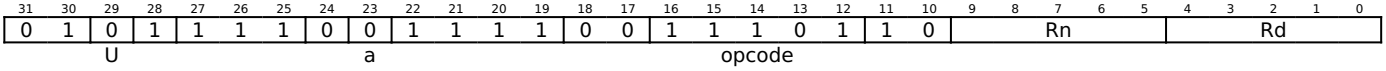
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
SCVTF <Hd>, <Hn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then

SDOT (by element)

Dot product signed arithmetic (vector, by element)

This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

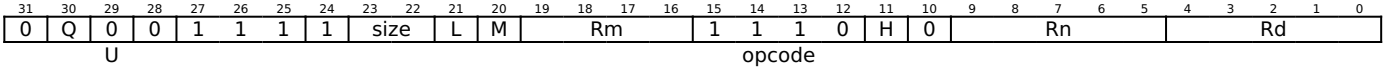
In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_AA64ISAR0_EL1.DP indicates whether this instruction is supported.

Vector

(FEAT_DotProd)



Encoding

```
SDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_DotProd) then EndOfDecode(Decode_UNDEF); end;
if size  != '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let m : integer = UInt(M::Rm);
let index : integer = UInt(H::L);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

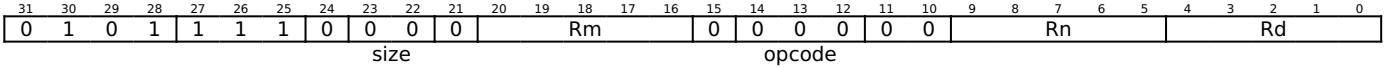
SHA1C

SHA1 hash update (choose)

This instruction reads the five 32-bit words of the SHA-1 working state from the first and second source vectors, together with four 32-bit values from the third source vector, each containing the sum of a message schedule word and the corresponding round constant. The working state undergoes four rounds of the SHA-1 hash computation, applying the choose function and additions defined by the SHA-1 standard. The updated first four words of the working state are destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1C <Qd>, <Sn>, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Qd>	Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var x : bits(128) = V{}(d);
var y : bits(32) = V{}(n);    // Note: 32 not 128 bits wide
let w : bits(128) = V{}(m);

for e = 0 to 3 do
    let t : bits(32) = SHAchoose(x[63:32], x[95:64], x[127:96]);
    y = y + ROL(x[31:0], 5) + t + w[e*:32];
    x[63:32] = ROL(x[63:32], 30);
    let yx : bits(160) = ROL(y::x, 32);
    (y, x) = (yx[159:128], yx[127:0]);
end;
V{128}(d) = x;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

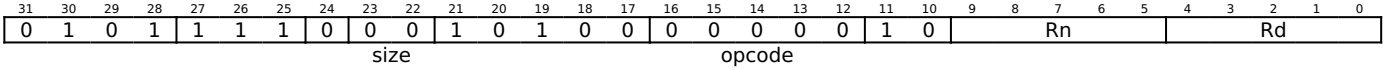
SHA1H

SHA1 fixed rotate

This instruction reads a 32-bit value from the source vector. The value undergoes the fixed 30-bit left rotate operation defined by the SHA-1 standard. The resulting 32-bit value is placed in the destination vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1H <Sd>, <Sn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
```

Assembler Symbols

<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let operand : bits(32) = V{}(n);        // read element [0] only,  [1-3] zeroed
V{32}(d) = ROL(operand, 30);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

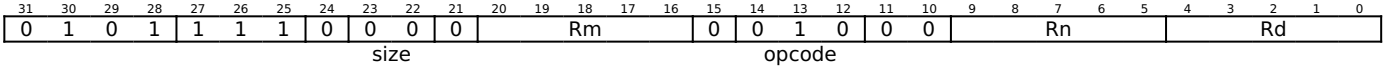
SHA1M

SHA1 hash update (majority)

This instruction reads the five 32-bit words of the SHA-1 working state from the first and second source vectors, together with four 32-bit values from the third source vector, each containing the sum of a message schedule word and the corresponding round constant. The working state undergoes four rounds of the SHA-1 hash computation, applying the majority function and additions defined by the SHA-1 standard. The updated first four words of the working state are destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1M <Qd>, <Sn>, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Qd>	Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var x : bits(128) = V{}(d);
var y : bits(32) = V{}(n);    // Note: 32 not 128 bits wide
let w : bits(128) = V{}(m);

for e = 0 to 3 do
    let t : bits(32) = SHAmajority{32}(x[63:32], x[95:64], x[127:96]);
    y = y + ROL(x[31:0], 5) + t + w[e*:32];
    x[63:32] = ROL(x[63:32], 30);
    let yx : bits(160) = ROL(y::x, 32);
    (y, x) = (yx[159:128], yx[127:0]);
end;
V{128}(d) = x;
```

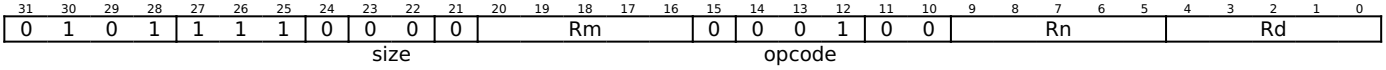
SHA1P

SHA1 hash update (parity)

This instruction reads the five 32-bit words of the SHA-1 working state from the first and second source vectors, together with four 32-bit values from the third source vector, each containing the sum of a message schedule word and the corresponding round constant. The working state undergoes four rounds of the SHA-1 hash computation, applying the parity function and additions defined by the SHA-1 standard. The updated first four words of the working state are destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1P <Qd>, <Sn>, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Qd>	Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var x : bits(128) = V{}(d);
var y : bits(32) = V{}(n);    // Note: 32 not 128 bits wide
let w : bits(128) = V{}(m);

for e = 0 to 3 do
    let t : bits(32) = SHAparity(x[63:32], x[95:64], x[127:96]);
    y = y + ROL(x[31:0], 5) + t + w[e*:32];
    x[63:32] = ROL(x[63:32], 30);
    let yx : bits(160) = ROL(y::x, 32);
    (y, x) = (yx[159:128], yx[127:0]);
end;
V{128}(d) = x;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

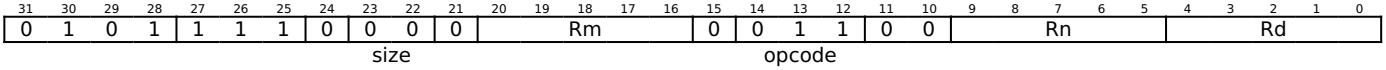
SHA1SU0

SHA1 schedule update 0

This instruction reads previously computed SHA-1 message schedule words from the three source vectors. The values undergo the first part of four successive SHA-1 message schedule updates, applying the exclusive-OR operations defined by the SHA-1 standard. The resulting four 32-bit intermediate values are destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1SU0 <Vd>.4S, <Vn>.4S, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let operand1 : bits(128) = V{}(d);
let operand2 : bits(128) = V{}(n);
let operand3 : bits(128) = V{}(m);
var result : bits(128) = operand2[63:0] :: operand1[127:64];
result = result XOR operand1 XOR operand3;
V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

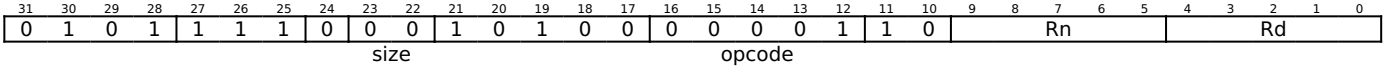
SHA1SU1

SHA1 schedule update 1

This instruction reads four intermediate values for SHA-1 message schedule updates from the first source vector, together with previously computed SHA-1 message schedule words from the second source vector. The values undergo the second part of four successive SHA-1 message schedule updates, applying the exclusive-OR and rotate operations defined by the SHA-1 standard. The resulting four 32-bit message schedule words are destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA1)



Encoding

```
SHA1SU1 <Vd>.4S, <Vn>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA1) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let operand1 : bits(128) = V{}(d);
let operand2 : bits(128) = V{}(n);
let T : bits(128) = operand1 XOR LSR(operand2, 32);

var result : bits(128);
result[31:0]   = ROL(T[31:0],   1);
result[63:32]  = ROL(T[63:32],  1);
result[95:64]  = ROL(T[95:64],  1);
result[127:96] = ROL(T[127:96], 1) XOR ROL(T[31:0], 2);
V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

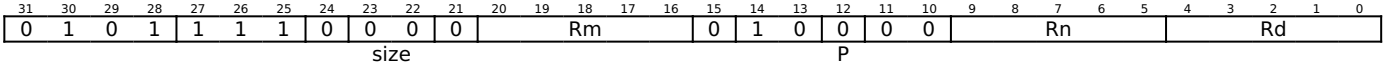
SHA256H

SHA-256 hash update (part 1)

This instruction reads the eight 32-bit words of the SHA-256 working state from the first and second source vectors, together with four 32-bit values from the third source vector, each containing the sum of a message schedule word and the corresponding round constant. The working state undergoes four rounds of the SHA-256 hash computation in accordance with the SHA-256 standard. The updated first half of the working state is destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA256)



Encoding

```
SHA256H <Qd>, <Qn>, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA256) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Qd>	Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
<Qn>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let part1 : boolean = TRUE;
V{128}(d) = SHA256hash(V{128}(d), V{128}(n), V{128}(m), part1);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

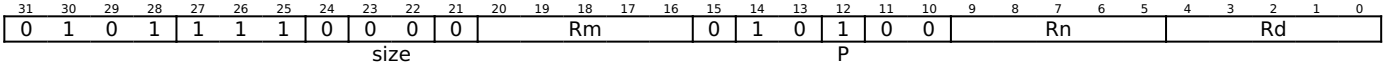
SHA256H2

SHA-256 hash update (part 2)

This instruction reads the eight 32-bit words of the SHA-256 working state from the first and second source vectors, together with four 32-bit values from the third source vector, each containing the sum of a message schedule word and the corresponding round constant. The two halves of the working state are supplied in the opposite order to SHA256H. The working state undergoes four rounds of the SHA-256 hash computation in accordance with the SHA-256 standard. The updated second half of the working state is destructively placed in the first source vector.

Advanced SIMD

(FEAT_SHA256)



Encoding

```
SHA256H2 <Qd>, <Qn>, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA256) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Qd>	Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
<Qn>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let part1 : boolean = FALSE;
V{128}(d) = SHA256hash(V{128}(n), V{128}(d), V{128}(m), part1);
```

SHA256SU0

SHA-256 schedule update 0

This instruction reads previously computed SHA-256 message schedule words from the first and second source vectors. The values undergo the first part of four successive SHA-256 message schedule updates, applying the sigma0 function and additions defined by the SHA-256 standard. The resulting four 32-bit intermediate values are destructively placed in the first source vector.

Advanced SIMD

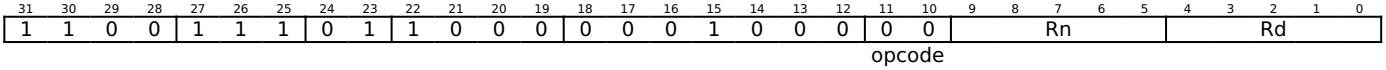
SHA512SU0

SHA-512 schedule update 0

This instruction takes the values from the two 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the gamma0 functions of two iterations of the SHA-512 schedule update that are performed after the first 16 iterations within a block. It returns this value to the destination SIMD&FP register.

Advanced SIMD

(FEAT_SHA512)



Encoding

```
SHA512SU0 <Vd>.2D, <Vn>.2D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA512) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var sig0 : bits(64);
var Vtmp : bits(128);
let x : bits(128) = V{}(n);
let w : bits(128) = V{}(d);
sig0 = ROR(w[127:64], 1) XOR ROR(w[127:64], 8) XOR ('0000000'::w[127:71]);
Vtmp[63:0] = w[63:0] + sig0;
sig0 = ROR(x[63:0], 1) XOR ROR(x[63:0], 8) XOR ('0000000'::x[63:7]);
Vtmp[127:64] = w[127:64] + sig0;
V{128}(d) = Vtmp;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SHADD

Signed halving add

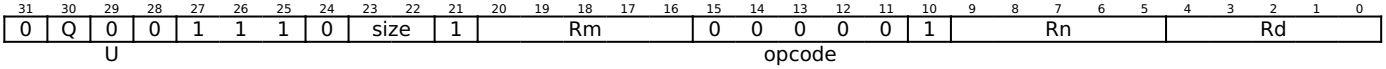
This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see *SRHADD*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
SHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;

SHL

Shift left (immediate)

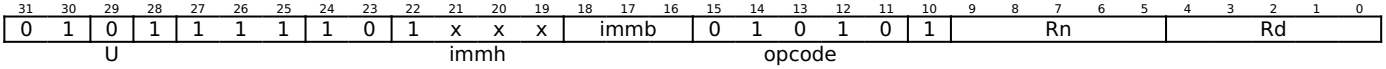
This instruction reads each value from a vector, left shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
SHL D<d>, D<n>, #<shift>
```

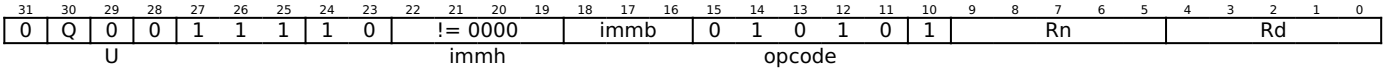
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] != '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << 3;
let datasize : integer{} = esize;
let elements : integer = 1;
let shift : integer = UInt(immh::immb) - esize;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
SHL <Vd>.<T>, <Vn>.<T>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3]::Q == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
let shift : integer = UInt(immh::immb) - esize;
```

Assembler Symbols

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<shift> For the "Scalar" variant: is the left shift amount, in the range 0 to 63, encoded as UInt("immh:immb") - 64.

For the "Vector" variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in "(immh :: immb)":

immh	<shift>
0001	UInt(immh :: immb) - 8
001x	UInt(immh :: immb) - 16
01xx	UInt(immh :: immb) - 32
1xxx	UInt(immh :: immb) - 64

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<T>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	0	RESERVED
1xxx	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);

for e = 0 to elements-1 do
    result[e*:esize] = LSL(operand[e*:esize], shift);
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SHLL, SHLL2

Shift left long (by element size)

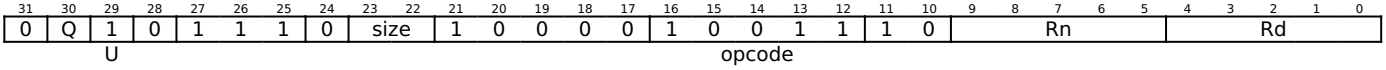
This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, left shifts each result by the element size, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The `SHLL` instruction extracts vector elements from the lower half of the source register. The `SHLL2` instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
SHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = esize;
```

Assembler Symbols

2 Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<shift> Is the left shift amount, which must be equal to the source element width in bits, encoded in “size”:

size	<shift>
00	8
01	16
10	32
11	RESERVED

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = Vpart{}(n, part);
var result : bits(2*datasize);
var element : integer;

for e = 0 to elements-1 do
    element = SInt(operand[e*:esize]) << shift;
    result[e*:(2*esize)] = element[2*esize-1:0];
end;

V{2*datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SHRN, SHRN2

Shift right narrow (immediate)

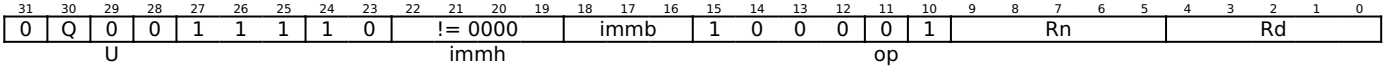
This instruction reads each unsigned integer value from the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are truncated. For rounded results, see *RSHRN*.

The SHRN instruction writes the vector to the lower half of the destination register and clears the upper half. The SHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
SHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] == '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh[2:0]);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = (2 * esize) - UInt(immh::immb);
let round : boolean = FALSE;
```

Assembler Symbols

2 Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<Tb>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	x	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in “immh”:

immh	<Ta>
0001	8H
001x	4S
01xx	2D
1xxx	RESERVED

<shift> Is the right shift amount, in the range 1 to the destination element width in bits, encoded in “(immh :: immb)”:

immh	<shift>
0001	16 - UInt(immh :: immb)
001x	32 - UInt(immh :: immb)
01xx	64 - UInt(immh :: immb)
1xxx	RESERVED

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize*2) = V{}(n);
var result : bits(datasize);
var element : integer;

for e = 0 to elements-1 do
    element = RShr(UInt(operand[e*:(2*esize)]), shift, round);
    result[e*:esize] = element[esize-1:0];
end;

Vpart{datasize}(d, part) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SHSUB

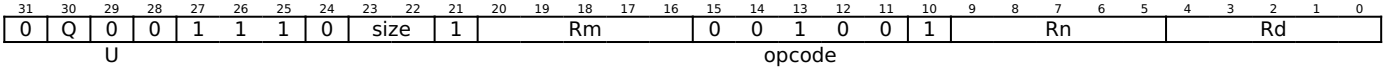
Signed halving subtract

This instruction subtracts the elements in the vector in the second source SIMD&FP register from the corresponding elements in the vector in the first source SIMD&FP register, shifts each result right one bit, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

(FEAT_AdvSIMD)



Encoding

```
SHSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);
var result : bits(datasize);
var element1 : integer;
var element2 : integer;
var diff : integer;

for e = 0 to elements-1 do
    element1 = SInt(operand1[e*:esize]);
    element2 = SInt(operand2[e*:esize]);
    diff = (element1 - element2) >> 1;
    result[e*:esize] = diff[esize-1:0];
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

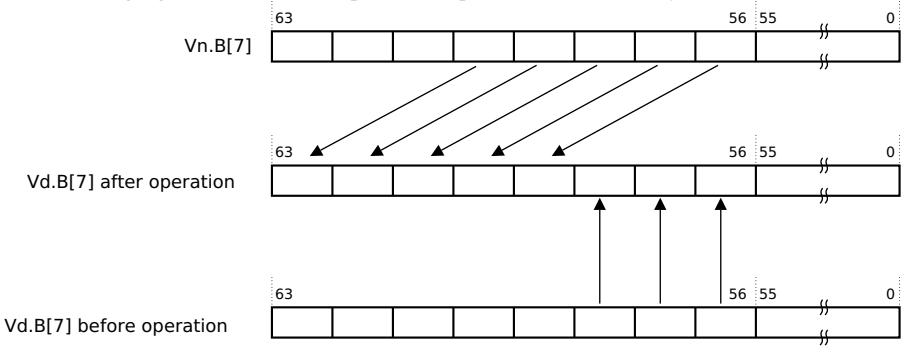
SLI

Shift left and insert (immediate)

This instruction reads each vector element in the source SIMD&FP register, left shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the left of each vector element in the source register are lost.

The following figure shows an example of the operation of shift left by 3 for an 8-bit vector element.

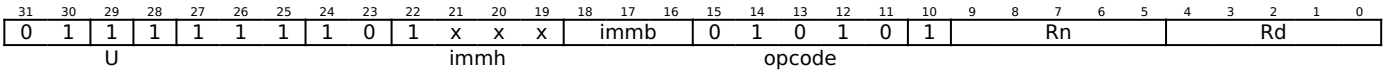


Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
SLI D<d>, D<n>, #<shift>
```

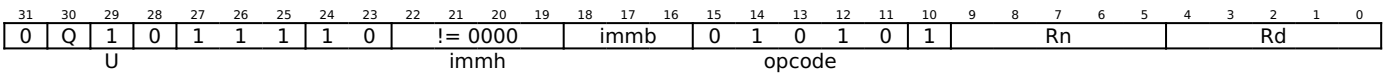
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] != '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << 3;
let datasize : integer{} = esize;
let elements : integer = 1;
let shift : integer = UInt(immh::immb) - esize;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
SLI <Vd>.<T>, <Vn>.<T>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3]::Q == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
let shift : integer = UInt(immh::immb) - esize;
```

Assembler Symbols

<d>	Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
<n>	Is the number of the SIMD&FP source register, encoded in the "Rn" field.
<shift>	For the "Scalar" variant: is the left shift amount, in the range 0 to 63, encoded as UInt("immh:immb") - 64.

For the "Vector" variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in “(immh :: immb)”:

immh	<shift>
0001	UInt(immh :: immb) - 8
001x	UInt(immh :: immb) - 16
01xx	UInt(immh :: immb) - 32
1xxx	UInt(immh :: immb) - 64

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<T>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	0	RESERVED
1xxx	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize)  = V{}(n);
let operand2 : bits(datasize) = V{}(d);
let mask : bits(esize) = LSL(Ones{esize}, shift);
var result : bits(datasize);
var shifted : bits(esize);

for e = 0 to elements-1 do
    shifted = LSL(operand[e*:esize], shift);
    result[e*:esize] = (operand2[e*:esize] AND NOT(mask)) OR shifted;
end;
V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

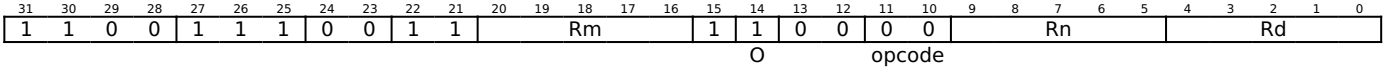
SM3PARTW1

SM3PARTW1

This instruction takes three 128-bit vectors from the three source SIMD&FP registers and returns a 128-bit result in the destination SIMD&FP register. The result is obtained by a three-way exclusive-OR of the elements within the input vectors with some fixed rotations, see the Operation pseudocode for more information.

Advanced SIMD

(FEAT_SM3)



Encoding

```
SM3PARTW1 <Vd>.4S, <Vn>.4S, <Vm>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SM3) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let Vm : bits(128) = V{}(m);
let Vn : bits(128) = V{}(n);
let Vd : bits(128) = V{}(d);
var result : bits(128);

result[95:0] = (Vd XOR Vn)[95:0] XOR (ROL(Vm[127:96], 15)::ROL(Vm[95:64], 15)::ROL(Vm[63:32], 15));

for i = 0 to 3 do
    if i == 3 then
        result[127:96] = (Vd XOR Vn)[127:96] XOR (ROL(result[31:0], 15));
    end;
    result[(32*i)+31:(32*i)] = (result[(32*i)+31:(32*i)] XOR ROL(result[(32*i)+31:(32*i)], 15) XOR
                                ROL(result[(32*i)+31:(32*i)], 23));
end;
V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SM3TT1A

SM3TT1A

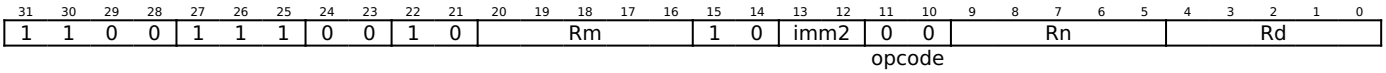
This instruction takes three 128-bit vectors from three source SIMD&FP registers and a 2-bit immediate index value, and returns a 128-bit result in the destination SIMD&FP register. It performs a three-way exclusive-OR of the three 32-bit fields held in the upper three elements of the first source vector, and adds the resulting 32-bit value and the following three other 32-bit values:

- The bottom 32-bit element of the first source vector, Vd, that was used for the three-way exclusive-OR.
- The result of the exclusive-OR of the top 32-bit element of the second source vector, Vn, with a rotation left by 12 of the top 32-bit element of the first source vector.
- A 32-bit element indexed out of the third source vector, Vm.

The result of this addition is returned as the top element of the result. The other elements of the result are taken from elements of the first source vector, with the element returned in bits<63:32> being rotated left by 9.

Advanced SIMD

(FEAT_SM3)



Encoding

```
SM3TT1A <Vd>.4S, <Vn>.4S, <Vm>.S[<imm2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SM3) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let i : integer = UInt(imm2);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the third SIMD&FP source register, encoded in the "Rm" field.
<imm2>	Is a 32-bit element indexed out of <Vm>, encoded in "imm2".

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let Vm : bits(128) = V{}(m);
let Vn : bits(128) = V{}(n);
let Vd : bits(128) = V{}(d);

var WjPrime : bits(32);
var result : bits(128);
var TT1 : bits(32);
var SS2 : bits(32);

WjPrime = Vm[i*:32];
SS2 = Vn[127:96] XOR ROL(Vd[127:96], 12);
TT1 = Vd[63:32] XOR (Vd[127:96] XOR Vd[95:64]);
TT1 = (TT1 + Vd[31:0] + SS2 + WjPrime)[31:0];
result[31:0] = Vd[63:32];
result[63:32] = ROL(Vd[95:64], 9);
result[95:64] = Vd[127:96];
result[127:96] = TT1;
V{128}(d) = result;
```

Operational information

SM3TT2B

SM3TT2B

This instruction takes three 128-bit vectors from three source SIMD&FP registers, and a 2-bit immediate index value, and returns a 128-bit result in the destination SIMD&FP register. It performs a 32-bit majority function between the three 32-bit fields held in the upper three elements of the first source vector, and adds the resulting 32-bit value and the following three other 32-bit values:

- The bottom 32-bit element of the first source vector, Vd, that was used for the 32-bit majority function.
- The 32-bit element held in the top 32 bits of the second source vector, Vn.
- A 32-bit element indexed out of the third source vector, Vm.

A three-way exclusive-OR is performed of the result of this addition, the result of the addition rotated left by 9, and the result of the addition rotated left by 17. The result of this exclusive-OR is returned as the top element of the returned result. The other elements of this result are taken from elements of the first source vector, with the element returned in bits<63:32> being rotated left by 19.

Advanced SIMD

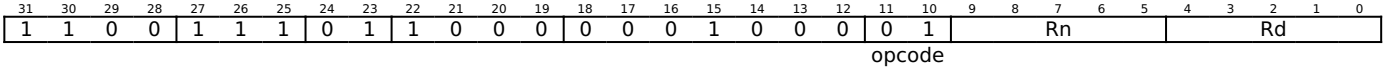
SM4E

SM4 encode

This instruction takes input data as a 128-bit vector from the first source SIMD&FP register, and four iterations of the round key held as the elements of the 128-bit vector in the second source SIMD&FP register. It encrypts the data by four rounds, in accordance with the SM4 standard, returning the 128-bit result to the destination SIMD&FP register.

Advanced SIMD

(FEAT_SM4)



Encoding

```
SM4E <Vd>.4S, <Vn>.4S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SM4) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let Vn : bits(128) = V{}(n);
var intval : bits(32);
var roundresult : bits(128);
var roundkey : bits(32);

roundresult = V{128}(d);
for index = 0 to 3 do
    roundkey = Vn[index*:32];

    intval = roundresult[127:96] XOR roundresult[95:64] XOR roundresult[63:32] XOR roundkey;

    for i = 0 to 3 do
        intval[i*:8]  = Sbox(intval[i*:8]);
    end;

    intval = intval XOR ROL(intval, 2) XOR ROL(intval, 10) XOR ROL(intval, 18) XOR ROL(intval, 24);
    intval = intval XOR roundresult[31:0];

    roundresult[31:0]   = roundresult[63:32];
    roundresult[63:32]  = roundresult[95:64];
    roundresult[95:64]  = roundresult[127:96];
    roundresult[127:96] = intval;
end;

V{128}(d) = roundresult;
```

Operational information

SMAX

Signed maximum (vector)

This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the larger of each pair of signed integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

SMLAL, SMLAL2 (by element)

Signed multiply-add long (vector, by element)

This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

The SMLAL instruction extracts vector elements from the lower half of the first source register. The SMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

SMLAL, SMLAL2 (vector)

Signed multiply-add long (vector)

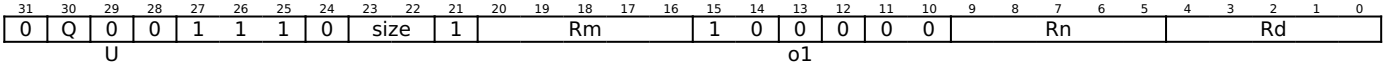
This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMLAL instruction extracts each source vector from the lower half of each source register. The SMLAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
SMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vm> — Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = Vpart{}(n, part);
let operand2 : bits(datasize) = Vpart{}(m, part);
let operand3 : bits(2*datasize) = V{}(d);
var result : bits(2*datasize);
var element1 : integer;
var element2 : integer;
var product : bits(2*esize);
var accum : bits(2*esize);

for e = 0 to elements-1 do
    element1 = SInt(operand1[e*:esize]);
    element2 = SInt(operand2[e*:esize]);
    product = (element1 * element2)[2*esize-1:0];
    accum = operand3[e*:(2*esize)] + product;
    result[e*:(2*esize)] = accum;
end;

V{2*datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SMLSL, SMLSL2 (by element)

Signed multiply-subtract long (vector, by element)

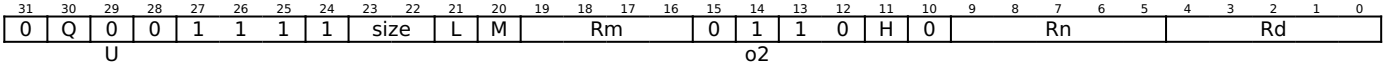
This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The `SMLSL` instruction extracts vector elements from the lower half of the first source register. The `SMLSL2` instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
SMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, V<m>.<Ts>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let idxdsize : integer{} = 64 << UInt(H);
var index : integer;
var Rmhi : bit;
case size of
    when '01' => index = UInt(H::L::M); Rmhi = '0';
    when '10' => index = UInt(H::L); Rmhi = M;
    otherwise => EndOfDecode(Decode_UNDEF);
end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let m : integer = UInt(Rmhi::Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]

SMMLA (vector)

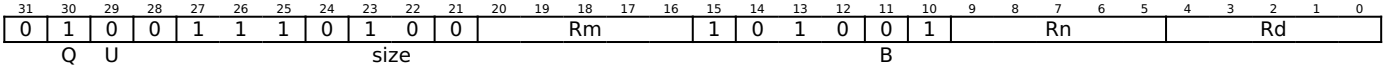
Signed 8-bit integer matrix multiply-accumulate to 32-bit integer (vector)

This instruction multiplies the 2x8 matrix of signed 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(FEAT_I8MM)



Encoding

```
SMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_I8MM) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let op1_unsigned : boolean = FALSE;
let op2_unsigned : boolean = FALSE;
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(128) = V{}(n);
let operand2 : bits(128) = V{}(m);
let addend : bits(128)   = V{}(d);

V{128}(d) = MatMulAdd(addend, operand1, operand2, op1_unsigned, op2_unsigned);
```

Operational information

Arm expects that the SMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two SDOT (vector) instructions, with a goal that it should have significantly higher throughput.

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SMOV

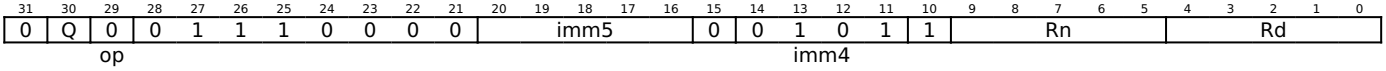
Signed move vector element to general-purpose register

This instruction reads the signed integer from the source SIMD&FP register, sign-extends it to form a 32-bit or 64-bit value, and writes the result to destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the 32-bit variant

Applies when `(Q == 0)`

```
SMOV <Wd>, <Vn>.<Ts>[<index>]
```

Encoding for the 64-bit variant

Applies when `(Q == 1)`

```
SMOV <Xd>, <Vn>.<Ts>[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if imm5 == 'xx000' then EndOfDecode(Decode_UNDEF); end;

let size : integer{} = LowestSetBitNZ(imm5[2:0]);

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << size;
let datasize : integer{} = 32 << UInt(Q);

if datasize <= esize then EndOfDecode(Decode_UNDEF); end;

let index : integer = UInt(imm5[4:size+1]);
let idxdsize : integer{} = 64 << UInt(imm5[4]);
```

Assembler Symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ts> For the "32-bit" variant: is an element size specifier, encoded in “imm5”:

imm5	<Ts>
xxx00	RESERVED
xxxx1	B
xxx10	H

For the "64-bit" variant: is an element size specifier, encoded in “imm5”:

imm5	<Ts>
xx000	RESERVED
xxxx1	B
xxx10	H
xx100	S

<index> For the "32-bit" variant: is the element index encoded in “imm5”:

imm5	<index>
xxx00	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])

For the "64-bit" variant: is the element index encoded in “imm5”:

imm5	<index>
xx000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Operation

```
if index == 0 then
    AArch64_CheckFPEnabled();
else
    AArch64_CheckFPAdvSIMDEnabled();
end;
let operand : bits(idxdsize) = V{idxdsize}(n);

X{datasize}(d) = SignExtend{datasize}(operand[index*:esize]);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SQABS

Signed saturating absolute value

This instruction reads each vector element from the source SIMD&FP register, puts the absolute value of the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

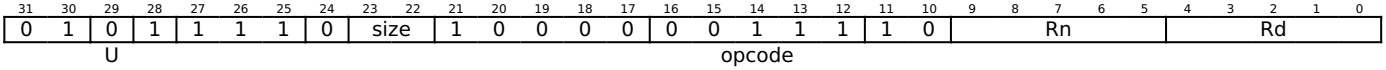
If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

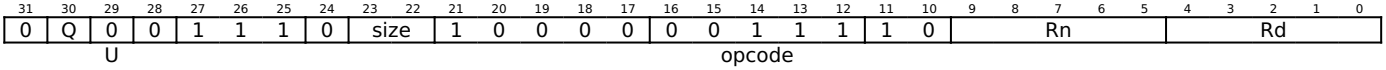
```
SQABS <V><d>, <V><n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = esize;
let elements : integer = 1;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
SQABS <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size::Q == '110' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);
var element : integer;
var sat : boolean;

for e = 0 to elements-1 do
    element = SInt(operand[e*:esize]);
    element = Abs(element);
    (result[e*:esize], sat) = SignedSatQ{esize}(element);
    if sat then FPSR().QC = '1'; end;
end;

V{datasize}(d) = result;
```

SQADD

Signed saturating add

This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

SQDMLAL, SQDMLAL2 (by element)

Signed saturating doubling multiply-add long (by element)

This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and accumulates the final results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The `SQDMLAL` instruction extracts vector elements from the lower half of the first source register. The `SQDMLAL2` instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQDMLSL, SQDMLSL2 (by element)

Signed saturating doubling multiply-subtract long (by element)

This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and subtracts the final results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The `SQDMLSL` instruction extracts vector elements from the lower half of the first source register. The `SQDMLSL2` instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SQDMULH (by element)

Signed saturating doubling multiply returning high half (by element)

This instruction multiplies each vector element in the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see *SQRDMULH*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQDMULH (vector)

Signed saturating doubling multiply returning high half

This instruction multiplies the values of corresponding elements of the two source SIMD&FP registers, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see *SQRDMULH*.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQDMULL, SQDMULL2 (by element)

Signed saturating doubling multiply long (by element)

This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the final results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The `SQDMULL` instruction extracts the first source vector from the lower half of the first source register. The `SQDMULL2` instruction extracts the first source vector from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Vector and Scalar

SQRDMLSH (by element)

Signed saturating rounding doubling multiply subtract returning high half (by element)

This instruction multiplies the vector elements of the first source SIMD&FP register with the value of a vector element of the second source SIMD&FP register without saturating the multiply results, doubles the results, and subtracts the most significant half of the final results from the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSR.QC, is set if saturation occurs.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQRSHL

Signed saturating rounding shift left (register)

This instruction takes each vector element in the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see *SQSHL*.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQRSHRN, SQRSHRN2

Signed saturating rounded shift right narrow (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see *SQSHRN*.

The SQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half. The SQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQRSHRUN, SQRSHRUN2

Signed saturating rounded shift right unsigned narrow (immediate)

This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are rounded. For truncated results, see *SQSHRUN*.

The SQRSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half. The SQRSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

SQSHL (register)

Signed saturating shift left (register)

This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see *SQRSHL*.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQSHRN, SQSHRN2

Signed saturating shift right narrow (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts and truncates each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. For rounded results, see *SQRSHRN*.

The SQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half. The SQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SQSHRUN, SQSHRUN2

Signed saturating shift right unsigned narrow (immediate)

This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see *SQRSHRUN*.

The SQSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half. The SQSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

SQXTN, SQXTN2

Signed saturating extract narrow

This instruction reads each vector element from the source SIMD&FP register, saturates the value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The `SQXTN` instruction writes the vector to the lower half of the destination register and clears the upper half. The `SQXTN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SRHADD

Signed rounding halving add

This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see *SHADD*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

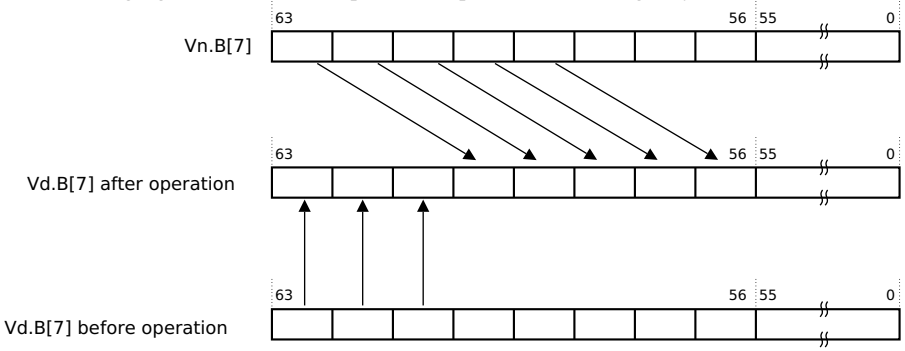
SRI

Shift right and insert (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows an example of the operation of shift right by 3 for an 8-bit vector element.



Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SRSHL

Signed rounding shift left (register)

This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see *SSHL*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SRSHR

Signed rounding shift right (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, places the final result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are rounded. For truncated results, see *SSHR*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

SSHL

Signed shift left (register)

This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts each value by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see *SRSHL*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

SSHLL, SSHLL2

Signed shift left long (immediate)

This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

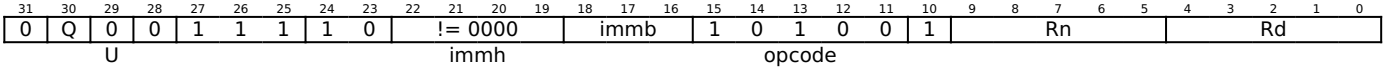
The `SSHLL` instruction extracts vector elements from the lower half of the source register. The `SSHLL2` instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias SXTL, SXTL2.

Vector

(FEAT_AdvSIMD)



Encoding

```
SSHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] == '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh[2:0]);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = UInt(immh::immb) - esize;
let unsigned : boolean = FALSE;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “immh”:

immh	<Ta>
0001	8H
001x	4S
01xx	2D
1xxx	RESERVED

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<Tb>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	x	RESERVED

<shift> Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in “(immh :: immb)”:

immh	<shift>
0001	UInt(immh :: immb) - 8
001x	UInt(immh :: immb) - 16
01xx	UInt(immh :: immb) - 32
1xxx	RESERVED

Alias Conditions

Alias	Is preferred when
SXTL, SXTL2	immb == '000' && BitCount(immh) == 1

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = Vpart{}(n, part);
var result : bits(datasize*2);

for e = 0 to elements-1 do
    let opelt : bits(esize) = operand[e*:esize];
    let element : integer = if unsigned then UInt(opelt) else SInt(opelt);
    result[e*:(2*esize)] = (element << shift)[2*esize-1:0];
end;

V{datasize*2}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SSUBL, SSUBL2

Signed subtract long

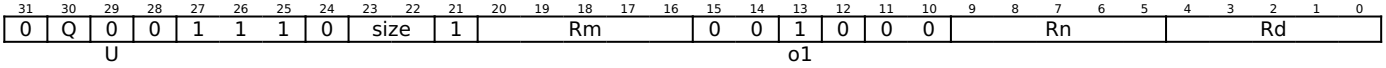
This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The `SSUBL` instruction extracts each source vector from the lower half of each source register. The `SSUBL2` instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
SSUBL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vm> — Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = Vpart{}(n, part);
let operand2 : bits(datasize) = Vpart{}(m, part);
var result : bits(2*datasize);
var element1 : integer;
var element2 : integer;
var sum : integer;

for e = 0 to elements-1 do
    element1 = SInt(operand1[e*:esize]);
    element2 = SInt(operand2[e*:esize]);
    sum = element1 - element2;
    result[e*:(2*esize)] = sum[2*esize-1:0];
end;

V{2*datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ST1 (multiple structures)

Store multiple single-element structures from one, two, three, or four registers

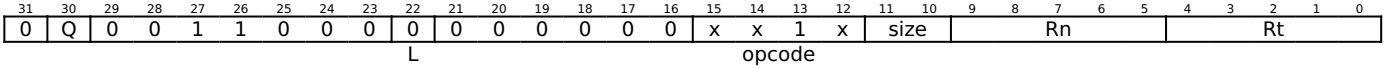
This instruction stores elements to memory from one, two, three, or four SIMD&FP registers, without interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the One register variant

Applies when (opcode == 0111)

```
ST1 { <Vt>.<T> }, [<Xn|SP>]
```

Encoding for the Two registers variant

Applies when (opcode == 1010)

```
ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

Encoding for the Three registers variant

Applies when (opcode == 0110)

```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

Encoding for the Four registers variant

Applies when (opcode == 0010)

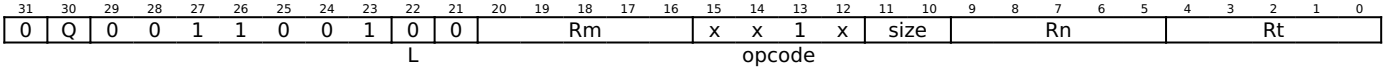
```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the One register, immediate offset variant

Applies when (Rm == 11111 && opcode == 0111)

```
ST1 { <Vt>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the One register, register offset variant

Applies when (Rm != 11111 && opcode == 0111)

```
ST1 { <Vt>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Two registers, immediate offset variant

Applies when (Rm == 11111 && opcode == 1010)

```
ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Two registers, register offset variant

Applies when (Rm != 11111 && opcode == 1010)

```
ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Three registers, immediate offset variant

Applies when `(Rm == 11111 && opcode == 0110)`

```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Three registers, register offset variant

Applies when `(Rm != 11111 && opcode == 0110)`

```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Encoding for the Four registers, immediate offset variant

Applies when `(Rm == 11111 && opcode == 0010)`

```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Four registers, register offset variant

Applies when `(Rm != 11111 && opcode == 0010)`

```
ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<imm> For the "One register, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#8
1	#16

For the "Two registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#16
1	#32

For the "Three registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#24
1	#48

For the "Four registers, immediate offset" variant: is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#32
1	#64

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

var rpt : integer;                // number of iterations
let selem : integer = 1;          // structure elements

case opcode of
    when '0010' => rpt = 4;    // LD/ST1 (4 registers)
    when '0110' => rpt = 3;    // LD/ST1 (3 registers)
    when '1010' => rpt = 2;    // LD/ST1 (2 registers)
    when '0111' => rpt = 1;    // LD/ST1 (1 register)
    otherwise => EndOfDecode(Decode_UNDEF);
end;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var address : bits(64);
var eaddr : bits(64);
var rval : bits(datasize);
var tt : integer;
var offs : bits(64) = Zeros{};

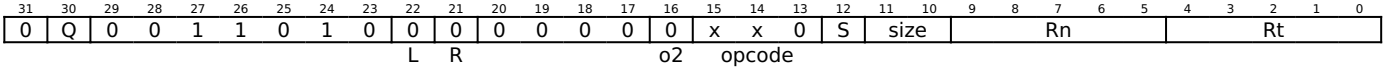
ST1 (single structure)

Store a single-element structure from one lane of one register

This instruction stores the specified element of a SIMD&FP register to memory.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when (opcode == 000)

```
ST1 { <Vt>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when (opcode == 010 && size == x0)

```
ST1 { <Vt>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when (opcode == 100 && size == 00)

```
ST1 { <Vt>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when (opcode == 100 && S == 0 && size == 01)

```
ST1 { <Vt>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);

ST2 (multiple structures)

Store multiple 2-element structures from two registers

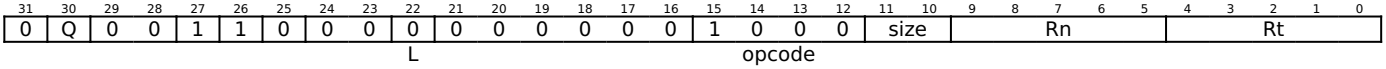
This instruction stores multiple 2-element structures from two SIMD&FP registers to memory, with interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

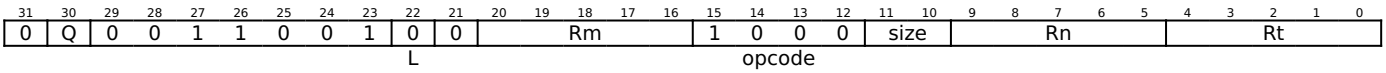
```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#16
1	#32

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);

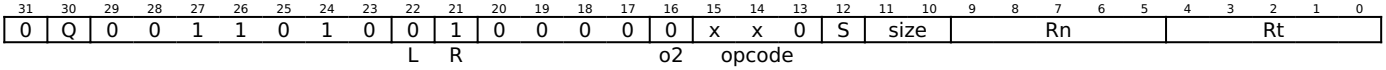
ST2 (single structure)

Store single 2-element structure from one lane of two registers

This instruction stores a 2-element structure to memory from corresponding elements of two SIMD&FP registers.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when (opcode == 000)

```
ST2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when (opcode == 010 && size == x0)

```
ST2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when (opcode == 100 && size == 00)

```
ST2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when (opcode == 100 && S == 0 && size == 01)

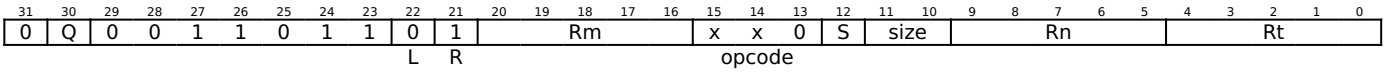
```
ST2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when (Rm == 11111 && opcode == 000)

```
ST2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>], #2
```

Encoding for the 8-bit, register offset variant

Applies when (Rm != 11111 && opcode == 000)

```
ST2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when (Rm == 11111 && opcode == 010 && size == x0)

```
ST2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>], #4
```

Encoding for the 16-bit, register offset variant

Applies when (Rm != 11111 && opcode == 010 && size == x0)

```
ST2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && size == 00)`

```
ST2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>], #8
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && size == 00)`

```
ST2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 100 && S == 0 && size == 01)`

```
ST2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>], #16
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 100 && S == 0 && size == 01)`

```
ST2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];

ST3 (multiple structures)

Store multiple 3-element structures from three registers

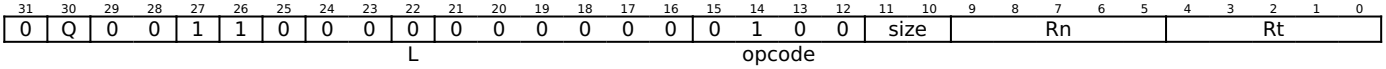
This instruction stores multiple 3-element structures to memory from three SIMD&FP registers, with interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

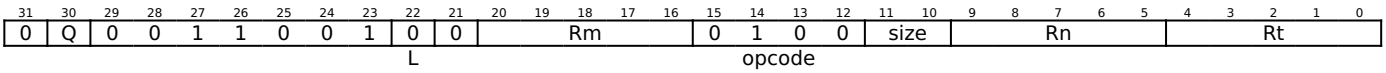
```
ST3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
ST3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
ST3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#24
1	#48

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

let rpt : integer = 1;                  // number of iterations

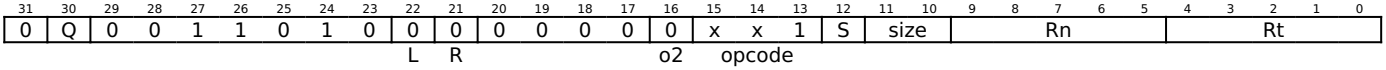
ST3 (single structure)

Store single 3-element structure from one lane of three registers

This instruction stores a 3-element structure to memory from corresponding elements of three SIMD&FP registers.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when (opcode == 001)

```
ST3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when (opcode == 011 && size == x0)

```
ST3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when (opcode == 101 && size == 00)

```
ST3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when (opcode == 101 && S == 0 && size == 01)

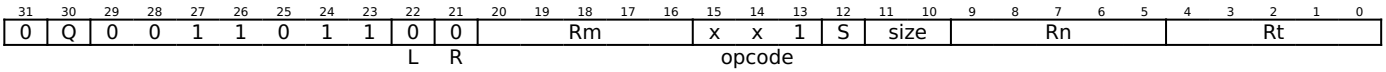
```
ST3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when (Rm == 11111 && opcode == 001)

```
ST3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>], #3
```

Encoding for the 8-bit, register offset variant

Applies when (Rm != 11111 && opcode == 001)

```
ST3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && size == 00)`

```
ST3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && S == 0 && size == 01)`

```
ST3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>], #24
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && S == 0 && size == 01)`

```
ST3 { <Vt>.D, <Vt2>.D, <Vt3>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3>	Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

ST4 (multiple structures)

Store multiple 4-element structures from four registers

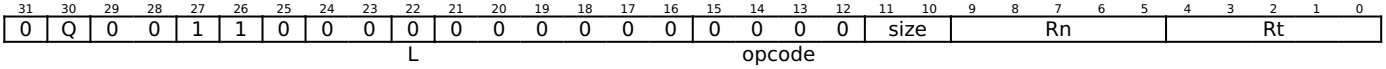
This instruction stores multiple 4-element structures to memory from four SIMD&FP registers, with interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding

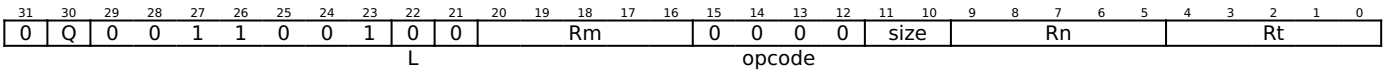
```
ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the Immediate offset variant

Applies when `(Rm == 11111)`

```
ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Encoding for the Register offset variant

Applies when `(Rm != 11111)`

```
ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in “Q”:

Q	<imm>
0	#32
1	#64

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(size);
let elements : integer = datasize DIV esize;

let rpt : integer = 1;                 // number of iterations
let selem : integer = 4;           // structure elements

// .1D format only permitted with LD1 & ST1
if size::Q == '110' && selem != 1 then EndOfDecode(Decode_UNDEF); end;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var address : bits(64);
var eaddr : bits(64);
var rval : bits(datasize);
var tt : integer;
var offs : bits(64) = Zeros{};
let ebytes : integer{} = esize DIV 8;

let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                                    tagchecked, privileged);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

for r = 0 to rpt - 1 do
    for e = 0 to elements - 1 do
        tt = (t + r) MOD 32;
        for s = 0 to selem - 1 do
            rval = V{datasize}(tt);
            eaddr = AddressIncrement(address, offs, accdesc);
            Mem{esize}(eaddr, accdesc) = rval[e *: esize];
            offs = offs + ebytes;
            tt = (tt + 1) MOD 32;
        end;
    end;
end;
if wback then
    if m != 31 then
        offs = X{64}(m);
    end;
    address = AddressAdd(address, offs, accdesc);
    if n == 31 then
        SP{64}() = address;
    else
        X{64}(n) = address;
    end;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

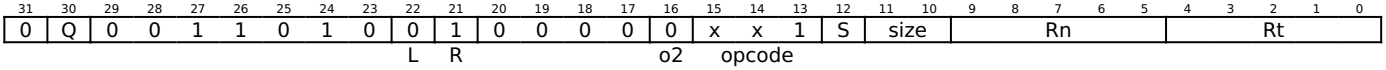
ST4 (single structure)

Store single 4-element structure from one lane of four registers

This instruction stores a 4-element structure to memory from corresponding elements of four SIMD&FP registers.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
It has encodings from 2 classes: No offset and Post-index

No offset

(FEAT_AdvSIMD)



Encoding for the 8-bit variant

Applies when (opcode == 001)

```
ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>]
```

Encoding for the 16-bit variant

Applies when (opcode == 011 && size == x0)

```
ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>]
```

Encoding for the 32-bit variant

Applies when (opcode == 101 && size == 00)

```
ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>]
```

Encoding for the 64-bit variant

Applies when (opcode == 101 && S == 0 && size == 01)

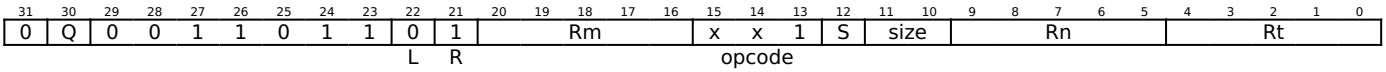
```
ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Post-index

(FEAT_AdvSIMD)



Encoding for the 8-bit, immediate offset variant

Applies when (Rm == 11111 && opcode == 001)

```
ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], #4
```

Encoding for the 8-bit, register offset variant

Applies when (Rm != 11111 && opcode == 001)

```
ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 16-bit, immediate offset variant

Applies when (Rm == 11111 && opcode == 011 && size == x0)

```
ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], #8
```

Encoding for the 16-bit, register offset variant

Applies when (Rm != 11111 && opcode == 011 && size == x0)

```
ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 32-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && size == 00)`

```
ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], #16
```

Encoding for the 32-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && size == 00)`

```
ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], <Xm>
```

Encoding for the 64-bit, immediate offset variant

Applies when `(Rm == 11111 && opcode == 101 && S == 0 && size == 01)`

```
ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], #32
```

Encoding for the 64-bit, register offset variant

Applies when `(Rm != 11111 && opcode == 101 && S == 0 && size == 01)`

```
ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], <Xm>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let wback : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Vt3>	Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
<Vt4>	Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
<index>	For the "8-bit", "8-bit, immediate offset", and "8-bit, register offset" variants: is the element index, encoded in "Q:S:size". For the "16-bit", "16-bit, immediate offset", and "16-bit, register offset" variants: is the element index, encoded in "Q:S:size<1>". For the "32-bit", "32-bit, immediate offset", and "32-bit, register offset" variants: is the element index, encoded in "Q:S". For the "64-bit", "64-bit, immediate offset", and "64-bit, register offset" variants: is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

case scale of
    when '11' =>
        // load and replicate
        if L == '0' || S == '1' then EndOfDecode(Decode_UNDEF); end;
        scale = size;
        replicate = TRUE;
    when '00' =>
        index = UInt(Q::S::size);     // B[0-15]
    when '01' =>

STBFADD, STBFADDL

Atomic BFloat16 floating-point add, without return

This instruction atomically loads a 16-bit value from memory, adds it to the BFloat16 value held in a register, and stores the result back to memory.

- `STBFADDL` stores to memory with release semantics.
- `STBFADD` has no release semantics.

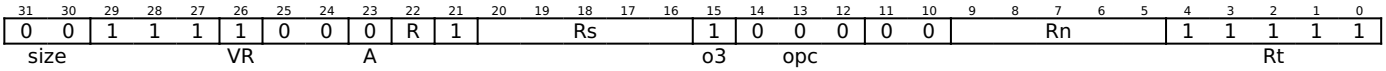
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(R == 0)`

```
STBFADD <Hs>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(R == 1)`

```
STBFADDL <Hs>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFADD, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

STBFMAX, STBFMAXL

Atomic BFloat16 floating-point maximum, without return

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 maximum with the value held in a register, and stores the result back to memory.

- `STBFMAXL` stores to memory with release semantics.
- `STBFMAX` has no release semantics.

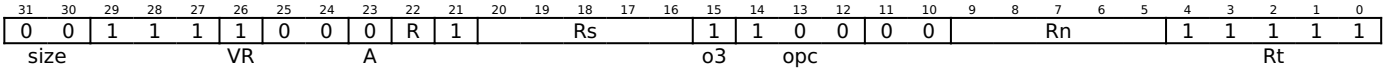
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(R == 0)`

```
STBFMAX <Hs>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(R == 1)`

```
STBFMAXL <Hs>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMAX, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

STBFMAXNM, STBFMAXNML

Atomic BFloat16 floating-point maximum number, without return

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 maximum number with the value held in a register, and stores the result back to memory.

- `STBFMAXNML` stores to memory with release semantics.
- `STBFMAXNM` has no release semantics.

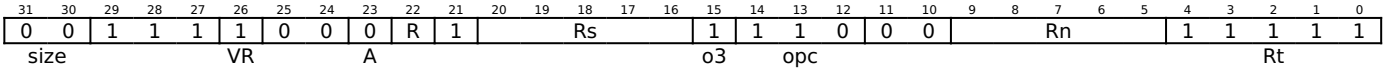
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(R == 0)`

```
STBFMAXNM <Hs>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(R == 1)`

```
STBFMAXNML <Hs>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMAXNM, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

STBFMIN, STBFMINL

Atomic BFloat16 floating-point minimum, without return

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 minimum with the value held in a register, and stores the result back to memory.

- `STBFMINL` stores to memory with release semantics.
- `STBFMIN` has no release semantics.

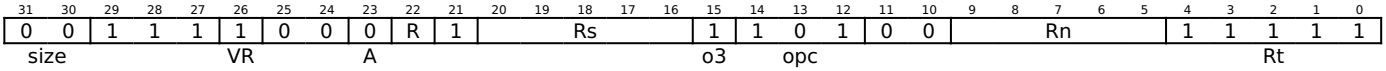
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(R == 0)`

```
STBFMIN <Hs>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(R == 1)`

```
STBFMINL <Hs>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMIN, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

STBFMINNM, STBFMINNML

Atomic BFloat16 floating-point minimum number, without return

This instruction atomically loads a 16-bit value from memory, calculates the BFloat16 minimum number with the value held in a register, and stores the result back to memory.

- `STBFMINNML` stores to memory with release semantics.
- `STBFMINNM` has no release semantics.

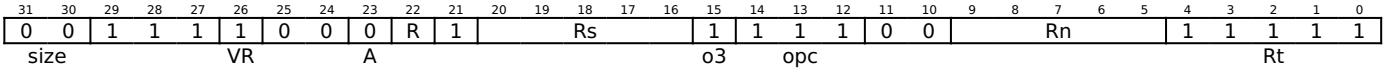
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the No memory ordering variant

Applies when `(R == 0)`

```
STBFMINNM <Hs>, [<Xn|SP>]
```

Encoding for the Release variant

Applies when `(R == 1)`

```
STBFMINNML <Hs>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 16;
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_BFMINNM, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

STFADD, STFADDL

Atomic floating-point add, without return

This instruction atomically loads a 16-bit, 32-bit, or 64-bit value from memory, performs a floating-point add with the value held in a register, and stores the result back to memory.

- `STFADDL` stores to memory with release semantics.
- `STFADD` has no release semantics.

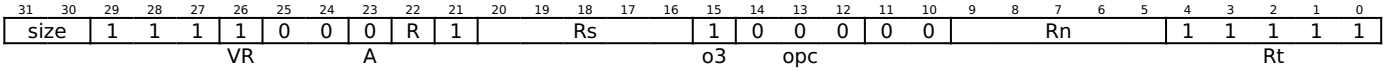
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the Half-precision no memory ordering variant

Applies when `(size == 01 && R == 0)`

```
STFADD <Hs>, [<Xn|SP>]
```

Encoding for the Half-precision release variant

Applies when `(size == 01 && R == 1)`

```
STFADDL <Hs>, [<Xn|SP>]
```

Encoding for the Single-precision no memory ordering variant

Applies when `(size == 10 && R == 0)`

```
STFADD <Ss>, [<Xn|SP>]
```

Encoding for the Single-precision release variant

Applies when `(size == 10 && R == 1)`

```
STFADDL <Ss>, [<Xn|SP>]
```

Encoding for the Double-precision no memory ordering variant

Applies when `(size == 11 && R == 0)`

```
STFADD <Ds>, [<Xn|SP>]
```

Encoding for the Double-precision release variant

Applies when `(size == 11 && R == 1)`

```
STFADDL <Ds>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 8 << UInt(size);
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Ss> Is the 32-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Ds> Is the 64-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_FPADD, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

STFMAX, STFMAXL

Atomic floating-point maximum, without return

This instruction atomically loads a 16-bit, 32-bit, or 64-bit value from memory, calculates the floating-point maximum with the value held in a register, and stores the result back to memory.

- `STFMAXL` stores to memory with release semantics.
- `STFMAX` has no release semantics.

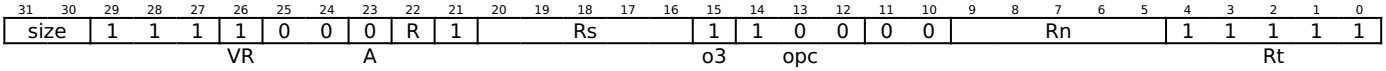
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the Half-precision no memory ordering variant

Applies when `(size == 01 && R == 0)`

```
STFMAX <Hs>, [<Xn|SP>]
```

Encoding for the Half-precision release variant

Applies when `(size == 01 && R == 1)`

```
STFMAXL <Hs>, [<Xn|SP>]
```

Encoding for the Single-precision no memory ordering variant

Applies when `(size == 10 && R == 0)`

```
STFMAX <Ss>, [<Xn|SP>]
```

Encoding for the Single-precision release variant

Applies when `(size == 10 && R == 1)`

```
STFMAXL <Ss>, [<Xn|SP>]
```

Encoding for the Double-precision no memory ordering variant

Applies when `(size == 11 && R == 0)`

```
STFMAX <Ds>, [<Xn|SP>]
```

Encoding for the Double-precision release variant

Applies when `(size == 11 && R == 1)`

```
STFMAXL <Ds>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 8 << UInt(size);
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Ss> Is the 32-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Ds> Is the 64-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
var value : bits(datasize);
var data : bits(datasize);
let accdesc : AccessDescriptor = CreateAccDescFPAtomicOp(MemAtomicOp_FPMAX, acquire,
                                                         release, tagchecked);

value = V{datasize}(s);
if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

// Irrelevant when not executing CAS
let comparevalue : bits(datasize) = ARBITRARY : bits(datasize);
data = MemAtomic{datasize}(address, comparevalue, value, accdesc);
```

STFMAXNM, STFMAXNML

Atomic floating-point maximum number, without return

This instruction atomically loads a 16-bit, 32-bit, or 64-bit value from memory, calculates the floating-point maximum number with the value held in a register, and stores the result back to memory.

- `STFMAXNML` stores to memory with release semantics.
- `STFMAXNM` has no release semantics.

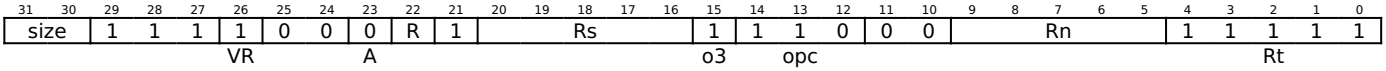
This instruction:

- Disables alternative floating-point behaviors, as if FPCR.AH is 0.
- Generates only the default NaN, as if FPCR.DN is 1.
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about addressing modes, see *Load/Store addressing modes*.

Floating-point

(FEAT_LSFE)



Encoding for the Half-precision no memory ordering variant

Applies when `(size == 01 && R == 0)`

```
STFMAXNM <Hs>, [<Xn|SP>]
```

Encoding for the Half-precision release variant

Applies when `(size == 01 && R == 1)`

```
STFMAXNML <Hs>, [<Xn|SP>]
```

Encoding for the Single-precision no memory ordering variant

Applies when `(size == 10 && R == 0)`

```
STFMAXNM <Ss>, [<Xn|SP>]
```

Encoding for the Single-precision release variant

Applies when `(size == 10 && R == 1)`

```
STFMAXNML <Ss>, [<Xn|SP>]
```

Encoding for the Double-precision no memory ordering variant

Applies when `(size == 11 && R == 0)`

```
STFMAXNM <Ds>, [<Xn|SP>]
```

Encoding for the Double-precision release variant

Applies when `(size == 11 && R == 1)`

```
STFMAXNML <Ds>, [<Xn|SP>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_LSFE) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Rn);
let s : integer = UInt(Rs);

let datasize : integer{} = 8 << UInt(size);
let acquire : boolean = FALSE;
let release : boolean = R == '1';
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Hs>	Is the 16-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Ss> Is the 32-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Ds> Is the 64-bit name of the SIMD&FP register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

Operation

```
AArch64_CheckFPEnabled();

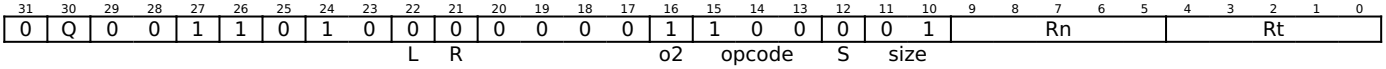
STL1 (SIMD&FP)

Store-release a single-element structure from one lane of one register

This instruction stores the specified element of a SIMD&FP register to memory.
The instruction also has memory ordering semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release*. For information about addressing modes, see *Load/Store addressing modes*.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

64-bit

(FEAT_AdvSIMD && FEAT_LRCPC3)



Encoding

```
STL1 { <Vt>.D }[<index>], [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_LRCPC3) then
    EndOfDecode(Decode_UNDEF);
end;
var t : integer = UInt(Rt);
let n : integer = UInt(Rn);
let m : integer = ARBITRARY : integer;
let wback : boolean = FALSE;
let tagchecked : boolean = wback || n != 31;
```

Assembler Symbols

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<index>	Is the element index, encoded in "Q".
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Shared Decode

```
var scale : bits(2) = opcode[2:1];
let selem : integer = UInt(opcode[0]::R) + 1;
var replicate : boolean = FALSE;
var index : integer;

case scale of
    when '11' =>
        // load and replicate
        if L == '0' || S == '1' then EndOfDecode(Decode_UNDEF); end;
        scale = size;
        replicate = TRUE;
    when '00' =>
        index = UInt(Q::S::size);     // B[0-15]
    when '01' =>
        if size[0] == '1' then EndOfDecode(Decode_UNDEF); end;
        index = UInt(Q::S::size[1]);  // H[0-7]
    when '10' =>
        if size[1] == '1' then EndOfDecode(Decode_UNDEF); end;
        if size[0] == '0' then
            index = UInt(Q::S);       // S[0-3]
        else
            if S == '1' then EndOfDecode(Decode_UNDEF); end;
            index = UInt(Q);          // D[0-1]
            scale = '11';
        end;
end;

let datasize : integer{} = 64 << UInt(Q);
let esize : integer{} = 8 << UInt(scale);
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

var address : bits(64);
var eaddr : bits(64);
var rval : bits(128);
var element : bits(esize);
var offs : bits(64) = Zeros{};
let ebytes : integer{} = esize DIV 8;

let accdesc : AccessDescriptor = CreateAccDescASIMDAcqRel(MemOp_STORE, tagchecked);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

if replicate then
    // load and replicate to all elements
    for s = 0 to selem - 1 do
        eaddr = AddressIncrement(address, offs, accdesc);
        element = Mem{esize}(eaddr, accdesc);
        // replicate to fill 128- or 64-bit register
        V{datasize}(t) = Replicate{datasize}(element);
        offs = offs + ebytes;
        t = (t + 1) MOD 32;
    end;
else
    // load/store one element per register
    for s = 0 to selem - 1 do
        rval = V{128}(t);
        eaddr = AddressIncrement(address, offs, accdesc);
        // extract from one lane of 128-bit register
        Mem{esize}(eaddr, accdesc) = rval[index *: esize];
        offs = offs + ebytes;
        t = (t + 1) MOD 32;
    end;
end;
if wback then
    if m != 31 then
        offs = X{64}(m);
    end;
    address = AddressAdd(address, offs, accdesc);
    if n == 31 then
        SP{64}() = address;
    else
        X{64}(n) = address;
    end;
end;
```

Operational information

STLUR (SIMD&FP)

Store-release SIMD&FP register (unscaled offset)

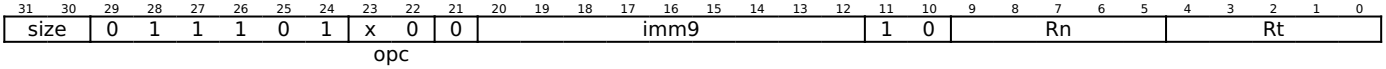
This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an optional immediate offset.

The instruction has memory ordering semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Unscaled offset

(FEAT_FP && FEAT_LRCPC3)



Encoding for the 8-bit variant

Applies when `(size == 00 && opc == 00)`

```
STLUR <Bt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 00)`

```
STLUR <Ht>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 00)`

```
STLUR <St>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 00)`

```
STLUR <Dt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 10)`

```
STLUR <Qt>, [<Xn|SP>{, #<simm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LRCPC3) then
    EndOfDecode(Decode_UNDEF);
end;
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let offset : bits(64) = SignExtend{}(imm9);
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm>	Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<St>	Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt>	Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 8 << scale;
let tagchecked : boolean = n != 31;
```

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
var address : bits(64);
let accdesc : AccessDescriptor = CreateAccDescASIMDAcqRel(MemOp_STORE, tagchecked);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

Mem{datasize}(address, accdesc) = V{datasize}(t);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

STNP (SIMD&FP)

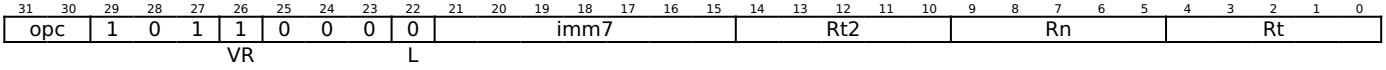
Store pair of SIMD&FP registers, with non-temporal hint

This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see *Load/Store SIMD and Floating-point non-temporal pair*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Signed offset

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
STNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
STNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
STNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for all variants of this encoding

```
// Empty.
```

Assembler Symbols

<St1>	Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<St2>	Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "32-bit" variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4. For the "64-bit" variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8. For the "128-bit" variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.
<Dt1>	Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt2>	Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.

Shared Decode

STP (SIMD&FP)

Store pair of SIMD&FP registers

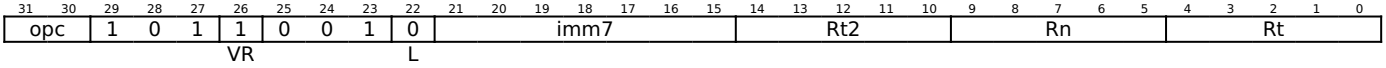
This instruction stores a pair of SIMD&FP registers to memory. The address used for the store is calculated from a base register value and an immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: Post-index , Pre-index and Signed offset

Post-index

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
STP <St1>, <St2>, [<Xn|SP>], #<imm>
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
STP <Dt1>, <Dt2>, [<Xn|SP>], #<imm>
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
STP <Qt1>, <Qt2>, [<Xn|SP>], #<imm>
```

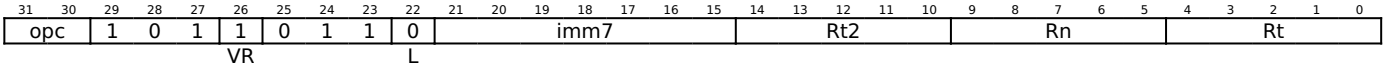
Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = TRUE;
let postindex : boolean = TRUE;
```

Pre-index

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
STP <St1>, <St2>, [<Xn|SP>, #<imm>]!
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
STP <Dt1>, <Dt2>, [<Xn|SP>, #<imm>]!
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
STP <Qt1>, <Qt2>, [<Xn|SP>, #<imm>]!
```

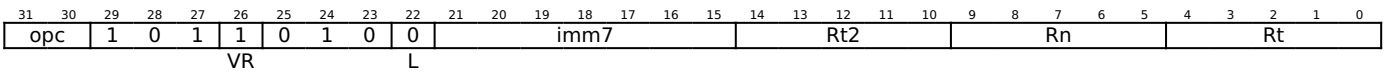
Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = TRUE;
let postindex : boolean = FALSE;
```

Signed offset

(FEAT_FP)



Encoding for the 32-bit variant

Applies when `(opc == 00)`

```
STP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 64-bit variant

Applies when `(opc == 01)`

```
STP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

Encoding for the 128-bit variant

Applies when `(opc == 10)`

```
STP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;

let wback : boolean = FALSE;
let postindex : boolean = FALSE;
```

Assembler Symbols

STR (register, SIMD&FP)

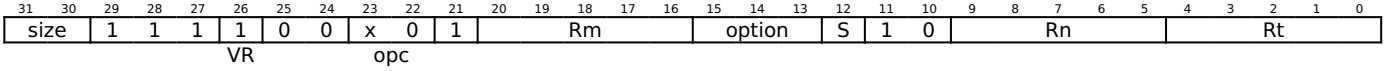
Store SIMD&FP register (register offset)

This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SIMD&FP registers

(FEAT_FP)



Encoding for the 8-bit with extended register offset variant

Applies when `(size == 00 && opc == 00 && option != 011)`

```
STR <Bt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]
```

Encoding for the 8-bit with shifted register offset variant

Applies when `(size == 00 && opc == 00 && option == 011)`

```
STR <Bt>, [<Xn|SP>, <Xm>{, LSL <amount>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 00)`

```
STR <Ht>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 00)`

```
STR <St>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 00)`

```
STR <Dt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 10)`

```
STR <Qt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if option[1] == '0' then EndOfDecode(Decode_UNDEF); end;          // sub-word index
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let extend_type : ExtendType = DecodeRegExtend(option);
let shift : integer{} = if S == '1' then scale else 0;
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Wm>	When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
<Xm>	When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
<extend>	For the "8-bit with extended register offset" variant: is the index extend specifier, encoded in “option”:

option	<extend>
010	UXTW
110	SXTW
111	SXTX

For the "128-bit", "16-bit", "32-bit", and "64-bit" variants: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted, encoded in “option”:

option	<extend>
010	UXTW
011	LSL
110	SXTW
111	SXTX

<amount>

For the "8-bit with extended register offset" and "8-bit with shifted register offset" variants: is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

For the "16-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#1

For the "32-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#2

For the "64-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#3

For the "128-bit" variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#4

<Ht>

Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<St>

Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Dt>

Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Qt>

Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let datasize : integer{} = 8 << scale;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = TRUE;
```

Operation

```
AArch64_CheckFPEnabled();
let offset : bits(64) = ExtendReg{}(m, extend_type, shift);
var address : bits(64);

let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_STORE, nontemporal, tagchecked,
                                                    privileged);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

Mem{datasize}(address, accdesc) = V{datasize}(t);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

STTNP (SIMD&FP)

Store unprivileged pair of SIMD&FP registers, with non-temporal hint

This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see *Load/Store SIMD and Floating-point non-temporal pair*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

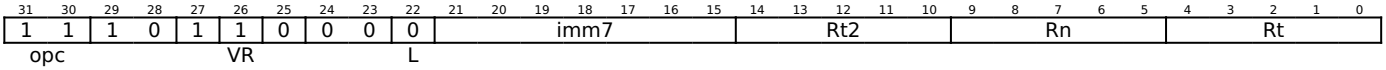
Explicit Memory effects produced by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of *HCR_EL2()*.{E2H, TGE} is '11'.

Otherwise, the Explicit Memory effects operate with the restrictions determined by the Exception level at which the instruction is executed.

Signed offset

(FEAT_FP && FEAT_LSUI)



Encoding

```
STTNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer{} = UInt(Rt);
let t2 : integer{} = UInt(Rt2);
let n : integer{} = UInt(Rn);
let nontemporal : boolean = TRUE;
let datasize : integer{} = 128;
let offset : bits(64) = LSL(SignExtend{64}(imm7), 4);
let tagchecked : boolean = n != 31;
```

Assembler Symbols

<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);

let privileged : boolean = AArch64_IsUnprivAccessPriv();
let ispair : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_STORE, nontemporal, tagchecked,
                                                    privileged, ispair);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

address = AddressAdd(address, offset, accdesc);

var data : bits(2*datasize);
if BigEndian(accdesc.acctype) then
    data = V{datasize}(t) :: V{datasize}(t2);
else
    data = V{datasize}(t2) :: V{datasize}(t);
end;
Mem{2*datasize}(address, accdesc) = data;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

STTP (SIMD&FP)

Store unprivileged pair of SIMD&FP registers

This instruction stores a pair of SIMD&FP registers to memory. The address used for the store is calculated from a base register value and an immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Explicit Memory effects produced by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

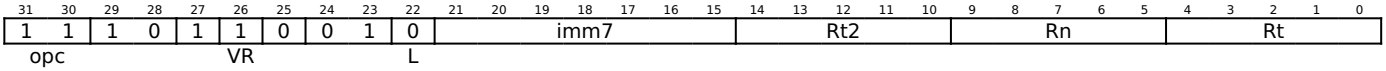
- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of *HCR_EL2()*.{E2H, TGE} is '11'.

Otherwise, the Explicit Memory effects operate with the restrictions determined by the Exception level at which the instruction is executed.

It has encodings from 3 classes: Post-index , Pre-index and Signed offset

Post-index

(FEAT_FP && FEAT_LSUI)



Encoding

```
STTP <Qt1>, <Qt2>, [<Xn|SP>], #<imm>
```

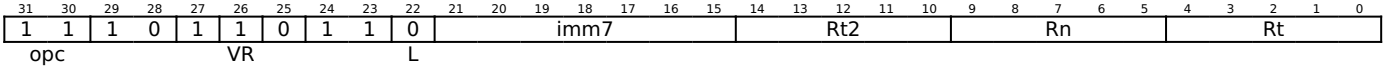
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = TRUE;
let postindex : boolean = TRUE;
```

Pre-index

(FEAT_FP && FEAT_LSUI)



Encoding

```
STTP <Qt1>, <Qt2>, [<Xn|SP>, #<imm>]!
```

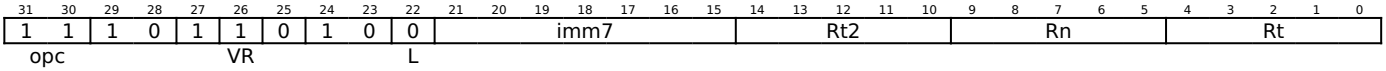
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = TRUE;
let postindex : boolean = FALSE;
```

Signed offset

(FEAT_FP && FEAT_LSUI)



Encoding

```
STTP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_FP) || !IsFeatureImplemented(FEAT_LSUI) then
    EndOfDecode(Decode_UNDEF);
end;

let wback : boolean = FALSE;
let postindex : boolean = FALSE;
```

Assembler Symbols

<Qt1>	Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2>	Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Post-index" and "Pre-index" variants: is the signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, encoded in the "imm7" field as <imm>/16. For the "Signed offset" variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Shared Decode

```
let t : integer{} = UInt(Rt);
let t2 : integer{} = UInt(Rt2);
let n : integer{} = UInt(Rn);
let nontemporal : boolean = FALSE;
let datasize : integer{} = 128;
let offset : bits(64) = LSL(SignExtend{64}(imm7), 4);
let tagchecked : boolean = wback || n != 31;
```

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);

let privileged : boolean = AArch64_IsUnprivAccessPriv();
let ispair : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                                    tagchecked, privileged, ispair);

if n == 31 then
    CheckSPAlignment();
    address = SP{64}();
else
    address = X{64}(n);
end;

if !postindex then
    address = AddressAdd(address, offset, accdesc);
end;

var data : bits(2*datasize);
if BigEndian(accdesc.acctype) then
    data = V{datasize}(t) :: V{datasize}(t2);
else
    data = V{datasize}(t2) :: V{datasize}(t);
end;

Mem{2*datasize}(address, accdesc) = data;

if wback then

STUR (SIMD&FP)

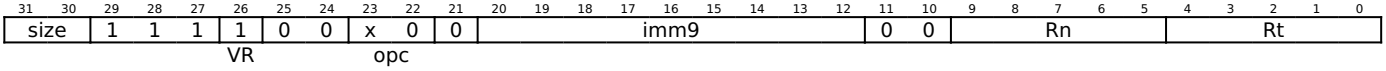
Store SIMD&FP register (unscaled offset)

This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Unscaled offset

(FEAT_FP)



Encoding for the 8-bit variant

Applies when `(size == 00 && opc == 00)`

```
STUR <Bt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 16-bit variant

Applies when `(size == 01 && opc == 00)`

```
STUR <Ht>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 32-bit variant

Applies when `(size == 10 && opc == 00)`

```
STUR <St>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 64-bit variant

Applies when `(size == 11 && opc == 00)`

```
STUR <Dt>, [<Xn|SP>{, #<simm>}]
```

Encoding for the 128-bit variant

Applies when `(size == 00 && opc == 10)`

```
STUR <Qt>, [<Xn|SP>{, #<simm>}]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_FP) then EndOfDecode(Decode_UNDEF); end;
if opc[1] == '1' && size != '00' then EndOfDecode(Decode_UNDEF); end;
let scale : integer{} = if opc[1] == '1' then 4 else UInt(size);
let offset : bits(64) = SignExtend{}(imm9);
```

Assembler Symbols

<Bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm>	Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
<Ht>	Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<St>	Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt>	Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

Shared Decode

```
let t : integer{} = UInt(Rt);
let n : integer{} = UInt(Rn);
let datasize : integer{} = 8 << scale;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
```

Operation

```
AArch64_CheckFPEnabled();
var address : bits(64);
let privileged : boolean = PSTATE.EL != EL0;
let accdesc : AccessDescriptor = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                                    tagchecked, privileged);

if n == 31 then

SUB (vector)

Subtract (vector)

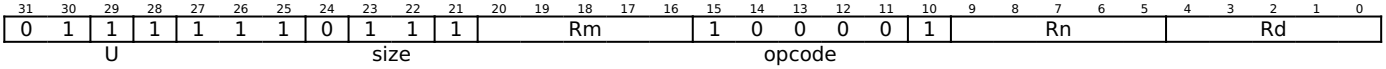
This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

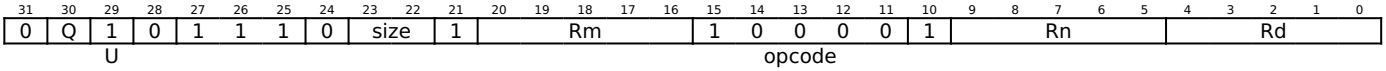
```
SUB D<d>, D<n>, D<m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size != '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = esize;
let elements : integer = 1;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
SUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size::Q == '110' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(datasize) = V{}(m);
var result : bits(datasize);
var element1 : bits(esize);
var element2 : bits(esize);

for e = 0 to elements-1 do
    element1 = operand1[e*:esize];
    element2 = operand2[e*:esize];
    result[e*:esize] = element1 - element2;
end;
V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SUBHN, SUBHN2

Subtract returning high narrow

This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

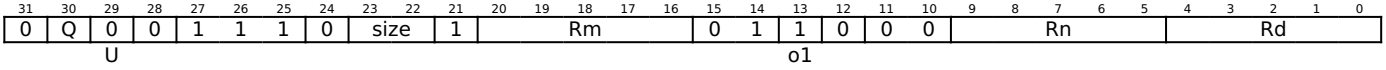
The results are truncated. For rounded results, see *RSUBHN*.

The SUBHN instruction writes the vector to the lower half of the destination register and clears the upper half. The SUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
SUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
let round : boolean = FALSE;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vm> — Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(2*datasize) = V{}(n);
let operand2 : bits(2*datasize) = V{}(m);
var result : bits(datasize);
var element1 : integer;
var element2 : integer;
var sum : integer;

for e = 0 to elements-1 do
    element1 = UInt(operand1[e*:(2*esize)]);
    element2 = UInt(operand2[e*:(2*esize)]);
    sum = element1 - element2;
    sum = RShr(sum, esize, round);
    result[e*:esize] = sum[esize-1:0];
end;

Vpart{datasize}(d, part) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SUDOT (by element)

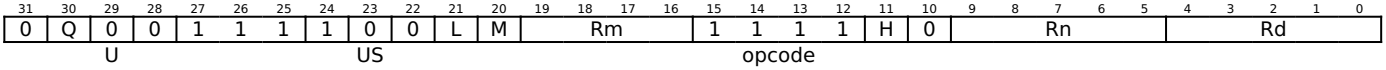
Dot product with signed and unsigned integers (vector, by element)

This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(FEAT_I8MM)



Encoding

```
SUDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_I8MM) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(M::Rm);
let d : integer = UInt(Rd);
let i : integer = UInt(H::L);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 32;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	2S
1	4S

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	8B
1	16B

<Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<index> Is the immediate index of a group of four 8-bit values, in the range 0 to 3, encoded in the "H:L" fields.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(128) = V{}(m);
let operand3 : bits(datasize) = V{}(d);
var result : bits(datasize);

for e = 0 to elements-1 do
    var res : bits(32) = operand3[e*:32];
    for b = 0 to 3 do
        let element1 : integer = SInt(operand1[(4 * e + b)*:8]);
        let element2 : integer = UInt(operand2[(4 * i + b)*:8]);
        res = res + element1 * element2;
    end;
    result[e*:32] = res;
end;
V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SUQADD

Signed saturating accumulate of unsigned value

This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register.

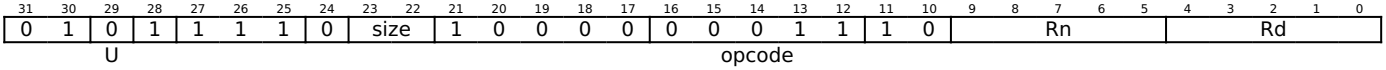
If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
SUQADD <V><d>, <V><n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = esize;
let elements : integer = 1;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
let unsigned : boolean = FALSE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize) = V{}(n);
var result : bits(datasize);

let operand2 : bits(datasize) = V{}(d);
var op1 : integer;
var op2 : integer;
var sat : boolean;

for e = 0 to elements-1 do
    op1 = UInt(operand[e*:esize]);
    op2 = SInt(operand2[e*:esize]);
    (result[e*:esize], sat) = SatQ{esize}(op1 + op2, unsigned);
    if sat then FPSR().QC = '1'; end;
end;
V{datasize}(d) = result;

SXTL, SXTL2

Signed extend long

This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The `SXTL` instruction extracts the source vector from the lower half of the source register. The `SXTL2` instruction extracts the source vector from the upper half of the source register.

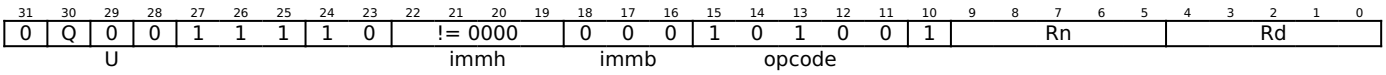
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of SSHLL, SSHLL2. This means:

- The encodings in this description are named to match the encodings of SSHLL, SSHLL2.
- The description of SSHLL, SSHLL2 gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Vector

(FEAT_AdvSIMD)



Encoding

```
SXTL{2} <Vd>.<Ta>, <Vn>.<Tb>
```

is equivalent to

```
SSHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #0
```

and is the preferred disassembly when `BitCount(immh) == 1`.

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “immh”:

immh	<Ta>
0001	8H
001x	4S
01xx	2D
1xxx	RESERVED

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<Tb>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	x	RESERVED

Operation

The description of SSHLL, SSHLL2 gives the operational pseudocode for this instruction.

Operational Information

The description of SSHLL, SSHLL2 gives the operational information for this instruction.

TBL

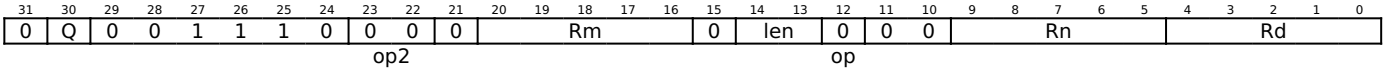
Table vector lookup

This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the Single register table variant

Applies when `(len == 00)`

```
TBL <Vd>.<Ta>, { <Vn>.16B }, <Vm>.<Ta>
```

Encoding for the Two register table variant

Applies when `(len == 01)`

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B }, <Vm>.<Ta>
```

Encoding for the Three register table variant

Applies when `(len == 10)`

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B }, <Vm>.<Ta>
```

Encoding for the Four register table variant

Applies when `(len == 11)`

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B, <Vn+3>.16B }, <Vm>.<Ta>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 8;
let regs : integer{} = UInt(len) + 1;
let is_tbl : boolean = (op == '0');
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	8B
1	16B

<Vn> For the "Single register table" variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.

For the "Four register table", "Three register table", and "Two register table" variants: is the name of the first SIMD&FP table register, encoded in the "Rn" field.

<Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.

<Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.

<Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.

<Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let indices : bits(datasize) = V{datasize}(m);
var table : bits(128*regs) = Zeros{};
var result : bits(datasize);
var index : integer;

// Create table from registers
for i = 0 to regs - 1 do
    table[i*:128] = V{128}((n+i) MOD 32);
end;

result = if is_tbl then Zeros{datasize} else V{datasize}(d);
for i = 0 to elements - 1 do
    index = UInt(indices[i*:8]);
    if index < 16 * regs then
        result[i*:8] = table[index*:8];
    end;
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

TBX

Table vector lookup extension

This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the existing value in the vector element of the destination register is left unchanged. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

TRN1

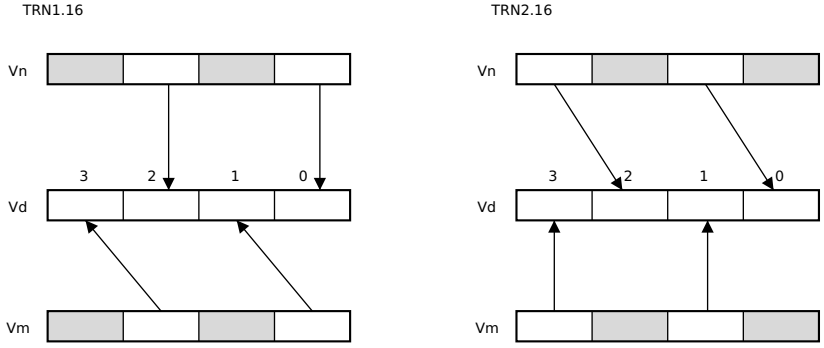
Transpose vectors (primary)

This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

Note

By using this instruction with `TRN2`, a 2 x 2 matrix can be transposed.

The following figure shows an example of the operation of TRN1 and TRN2 halfword operations where Q = 0.



Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UADALP

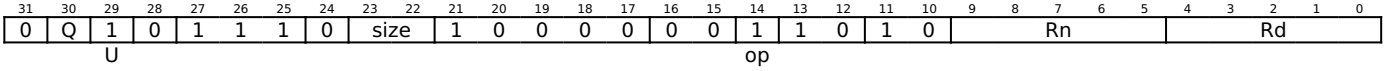
Unsigned add and accumulate long pairwise

This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
UADALP <Vd>.<Ta>, <Vn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV (2 * esize);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Ta>
00	0	4H
00	1	8H
01	0	2S
01	1	4S
10	0	1D
10	1	2D
11	x	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B

UADDL, UADDL2

Unsigned add long (vector)

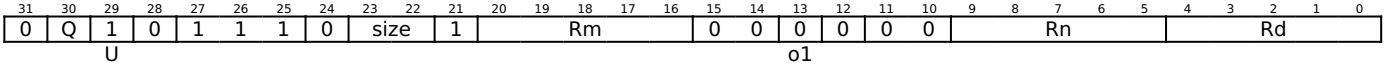
This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The `UADDL` instruction extracts each source vector from the lower half of each source register. The `UADDL2` instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
UADDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

UADDW, UADDW2

Unsigned add wide

This instruction adds the vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register. All the values in this instruction are unsigned integer values.

The `UADDW` instruction extracts vector elements from the lower half of the second source register. The `UADDW2` instruction extracts vector elements from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

UCVTF (scalar SIMD&FP)

Unsigned integer convert to floating-point (scalar SIMD&FP)

This instruction converts the unsigned integer value in the SIMD&FP source register to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UCVTF (vector, fixed-point)

Unsigned fixed-point convert to floating-point (vector)

This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

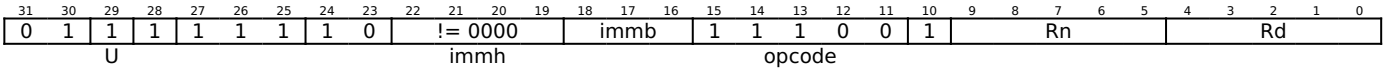
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
UCVTF <V><d>, <V><n>, #<fbits>
```

Decode for this encoding

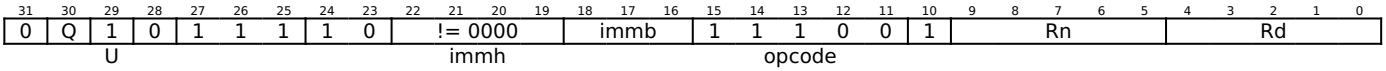
```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh IN {'000x'} || (immh IN {'001x'} && !IsFeatureImplemented(FEAT_FP16)) then
    EndOfDecode(Decode_UNDEF);
end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = if immh IN {'1xxx'} then 64 else if immh IN {'01xx'} then 32 else 16;
let datasize : integer{} = esize;
let elements : integer = 1;

let fracbits : integer = (esize * 2) - UInt(immh::immb);
let unsigned : boolean = TRUE;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
UCVTF <Vd>.<T>, <Vn>.<T>, #<fbits>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh IN {'000x'} || (immh IN {'001x'} && !IsFeatureImplemented(FEAT_FP16)) then
    EndOfDecode(Decode_UNDEF);
end;
if immh[3]::Q == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = if immh IN {'1xxx'} then 64 else if immh IN {'01xx'} then 32 else 16;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;

let fracbits : integer = (esize * 2) - UInt(immh::immb);
let unsigned : boolean = TRUE;
```

Assembler Symbols

<V>

Is a width specifier, encoded in “immh”:

immh	<V>	Architectural Feature
0001	RESERVED	-
001x	H	FEAT_FP16
01xx	S	-
1xxx	D	-

<d>

Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<fbits> For the "Scalar" variant: is the number of fractional bits, in the range 1 to the operand width, encoded in “(immh :: immb)”:

immh	<fbits>
0001	RESERVED
001x	32 - UInt(immh :: immb)
01xx	64 - UInt(immh :: immb)
1xxx	128 - UInt(immh :: immb)

For the "Vector" variant: is the number of fractional bits, in the range 1 to the element width, encoded in “(immh :: immb)”:

immh	<fbits>
0001	RESERVED
001x	32 - UInt(immh :: immb)
01xx	64 - UInt(immh :: immb)
1xxx	128 - UInt(immh :: immb)

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<T>	Architectural Feature
0001	x	RESERVED	-
001x	0	4H	FEAT_FP16
001x	1	8H	FEAT_FP16
01xx	0	2S	-
01xx	1	4S	-
1xxx	0	RESERVED	-
1xxx	1	2D	-

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize)  = V{}(n);
let rounding : FPRounding = FPRoundingMode(FPCR());

let merge : boolean = elements == 1 && IsMerging(FPCR());
var result : bits(128) = if merge then V{128}(d) else Zeros{128};
var element : bits(esize);

for e = 0 to elements-1 do
    element = operand[e*:esize];
    result[e*:esize] = FixedToFP{esize, esize}(element, fracbits, unsigned, FPCR(), rounding);
end;

V{128}(d) = result;
```

UCVTF (vector, integer)

Unsigned integer convert to floating-point (vector)

This instruction converts each element in a vector from an unsigned integer value to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

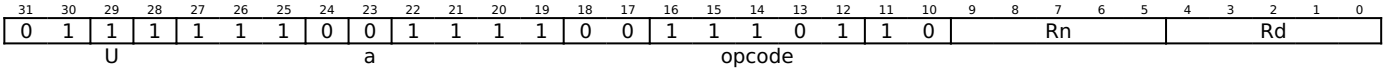
This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half-precision , Scalar single-precision and double-precision , Vector half-precision and Vector single-precision and double-precision

Scalar half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
UCVTF <Hd>, <Hn>
```

Decode for this encoding

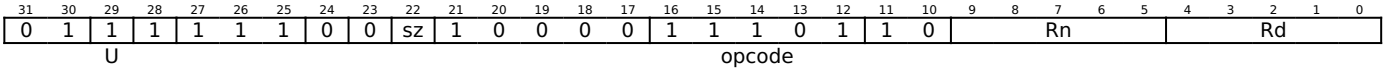
```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let esize : integer{} = 16;
let datasize : integer{} = esize;
let elements : integer = 1;

let unsigned : boolean = TRUE;
```

Scalar single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
UCVTF <V><d>, <V><n>
```

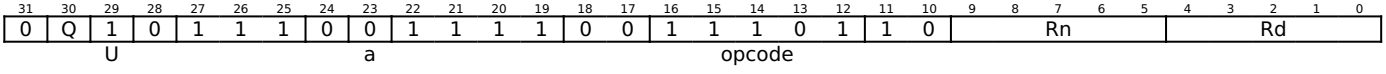
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let esize : integer{} = 32 << UInt(sz);
let datasize : integer{} = esize;
let elements : integer = 1;
let unsigned : boolean = TRUE;
```

Vector half-precision

(FEAT_AdvSIMD && FEAT_FP16)



Encoding

```
UCVTF <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) || !IsFeatureImplemented(FEAT_FP16) then
    EndOfDecode(Decode_UNDEF);
end;

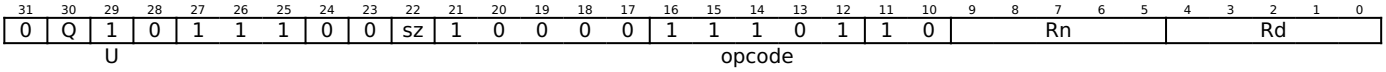
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

let esize : integer{} = 16;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;

let unsigned : boolean = TRUE;
```

Vector single-precision and double-precision

(FEAT_AdvSIMD)



Encoding

```
UCVTF <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

if sz::Q == '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32 << UInt(sz);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;

let unsigned : boolean = TRUE;
```

Assembler Symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<V> Is a width specifier, encoded in “sz”:

sz	<V>
0	S
1	D

UDOT (by element)

Dot product unsigned arithmetic (vector, by element)

This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

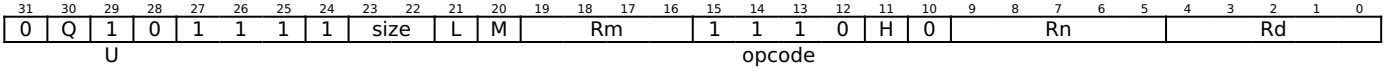
In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_AA64ISAR0_EL1.DP indicates whether this instruction is supported.

Vector

(FEAT_DotProd)



Encoding

```
UDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_DotProd) then EndOfDecode(Decode_UNDEF); end;
if size  != '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let m : integer = UInt(M::Rm);
let index : integer = UInt(H::L);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	2S
1	4S

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	8B
1	16B

<Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<index> Is the element index, encoded in the "H:L" fields.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{}(n);
let operand2 : bits(128) = V{}(m);
var result : bits(datasize) = V{}(d);
for e = 0 to elements-1 do
    var res : integer = 0;
    var element1, element2 : integer;
    for i = 0 to 3 do
        element1 = UInt(operand1[(4 * e + i)*:(esize DIV 4)]);
        element2 = UInt(operand2[(4 * index + i)*:(esize DIV 4)]);

        res = res + element1 * element2;
    end;
    result[e*:esize] = result[e*:esize] + res;
end;
V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMIN

Unsigned minimum (vector)

This instruction compares corresponding vector elements in the two source SIMD&FP registers, places the smaller of each of the two unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type

UMINP

Unsigned minimum pairwise

This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UMLAL, UMLAL2 (by element)

Unsigned multiply-add long (vector, by element)

This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The `UMLAL` instruction extracts vector elements from the lower half of the first source register. The `UMLAL2` instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UMMLA (vector)

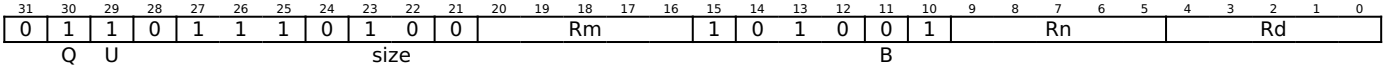
Unsigned 8-bit integer matrix multiply-accumulate to 32-bit integer (vector)

This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(FEAT_I8MM)



Encoding

```
UMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_I8MM) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let op1_unsigned : boolean = TRUE;
let op2_unsigned : boolean = TRUE;
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(128) = V{}(n);
let operand2 : bits(128) = V{}(m);
let addend : bits(128)   = V{}(d);

V{128}(d) = MatMulAdd(addend, operand1, operand2, op1_unsigned, op2_unsigned);
```

Operational information

Arm expects that the UMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two UDOT (vector) instructions, with a goal that it should have significantly higher throughput.

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMOV

Unsigned move vector element to general-purpose register

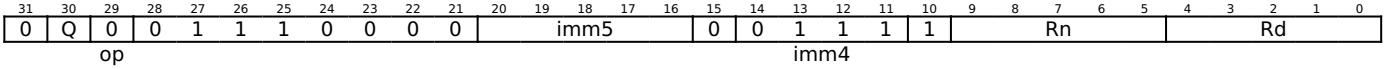
This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (to general).

Advanced SIMD

(FEAT_AdvSIMD)



Encoding for the 32-bit variant

Applies when `(Q == 0)`

```
UMOV <Wd>, <Vn>.<Ts>[<index>]
```

Encoding for the 64-bit variant

Applies when `(Q == 1 && imm5 == x1000)`

```
UMOV <Xd>, <Vn>.D[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if imm5 == 'x0000' then EndOfDecode(Decode_UNDEF); end;

let size : integer{} = LowestSetBitNZ(imm5[3:0]);

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << size;
let datasize : integer{} = 32 << UInt(Q);

if datasize == 64 && esize < 64 then EndOfDecode(Decode_UNDEF); end;
if datasize == 32 && esize >= 64 then EndOfDecode(Decode_UNDEF); end;

let index : integer = UInt(imm5[4:size+1]);
let idxdsize : integer{} = 64 << UInt(imm5[4]);
```

Assembler Symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ts> Is an element size specifier, encoded in “imm5”:

imm5	<Ts>
xx000	RESERVED
xxxx1	B
xxx10	H
xx100	S

<index> For the "32-bit" variant: is the element index encoded in “imm5”:

imm5	<index>
xx000	RESERVED
xxxx1	UInt(imm5[4:1])
xxx10	UInt(imm5[4:2])
xx100	UInt(imm5[4:3])

For the "64-bit" variant: is the element index encoded in "imm5<4>".

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Alias Conditions

Alias	Of variant	Is preferred when
MOV (to general)	32-bit	`imm5 IN {'xx100'}`

Alias	Of variant	Is preferred when
MOV (to general)	64-bit	`imm5 IN {'x1000'}`

Operation

```
if index == 0 then
    AArch64_CheckFPEnabled();
else
    AArch64_CheckFPAdvSIMDEnabled();
end;
let operand : bits(idxdsize) = V{idxdsize}(n);

X{datasize}(d) = ZeroExtend{datasize}(operand[index*:esize]);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMULL, UMULL2 (by element)

Unsigned multiply long (vector, by element)

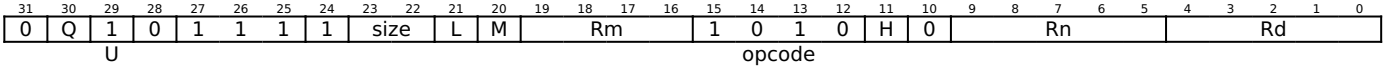
This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The `UMULL` instruction extracts vector elements from the lower half of the first source register. The `UMULL2` instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, V<m>.<Ts>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let idxdsize : integer{} = 64 << UInt(H);
var index : integer;
var Rmhi : bit;
case size of
    when '01' => index = UInt(H::L::M); Rmhi = '0';
    when '10' => index = UInt(H::L); Rmhi = M;
    otherwise => EndOfDecode(Decode_UNDEF);
end;

let d : integer = UInt(Rd);
let n : integer = UInt(Rn);
let m : integer = UInt(Rmhi::Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]

UMULL, UMULL2 (vector)

Unsigned multiply long (vector)

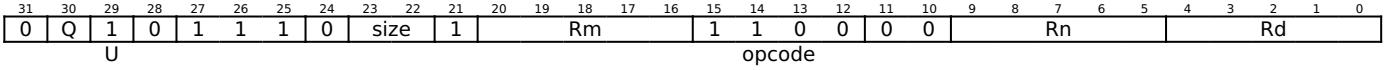
This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, places the result in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The `UMULL` instruction extracts each source vector from the lower half of each source register. The `UMULL2` instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

(FEAT_AdvSIMD)



Encoding

```
UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vn> — Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

UQADD

Unsigned saturating add

This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQRSHL

Unsigned saturating rounding shift left (register)

This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see *UQSHL*.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQRSHRN, UQRSHRN2

Unsigned saturating rounded shift right narrow (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see *UQSHRN*.

The `UQRSHRN` instruction writes the vector to the lower half of the destination register and clears the upper half. The `UQRSHRN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQSHL (register)

Unsigned saturating shift left (register)

This instruction takes each element in the vector of the first source SIMD&FP register, shifts the element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see *UQRSHL*.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQSHRN, UQSHRN2

Unsigned saturating shift right narrow (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see *UQRSHRN*.

The `UQSHRN` instruction writes the vector to the lower half of the destination register and clears the upper half. The `UQSHRN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

URSHR

Unsigned rounding shift right (immediate)

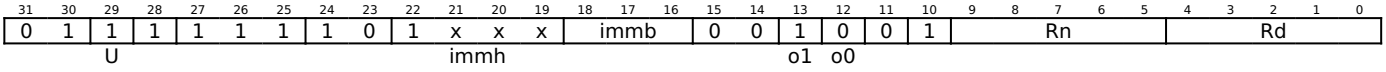
This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see *USHR*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
URSHR D<d>, D<n>, #<shift>
```

Decode for this encoding

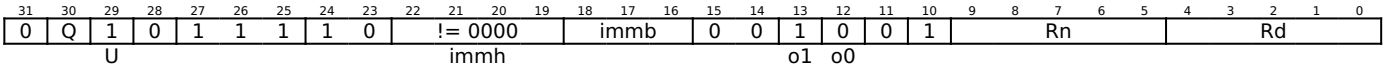
```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] != '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << 3;
let datasize : integer{} = esize;
let elements : integer = 1;

let shift : integer = (esize * 2) - UInt(immh::immb);
let unsigned : boolean = TRUE;
let round : boolean = TRUE;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
URSHR <Vd>.<T>, <Vn>.<T>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3]::Q == '10' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = (esize * 2) - UInt(immh::immb);
let unsigned : boolean = TRUE;
let round : boolean = TRUE;
```

Assembler Symbols

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the "Scalar" variant: is the right shift amount, in the range 1 to 64, encoded as 128 - UInt("immh:immb").

For the "Vector" variant: is the right shift amount, in the range 1 to the element width in bits, encoded in “(immh :: immb)”:

immh	<shift>
0001	16 - UInt(immh :: immb)
001x	32 - UInt(immh :: immb)
01xx	64 - UInt(immh :: immb)
1xxx	128 - UInt(immh :: immb)

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<T>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	0	RESERVED
1xxx	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(datasize)  = V{}(n);
var result : bits(datasize);
var element : integer;

for e = 0 to elements-1 do
    let opelt : bits(esize) = operand[e*:esize];
    if unsigned then
        element = RShr(UInt(opelt), shift, round);
    else
        element = RShr(SInt(opelt), shift, round);
    end;
    result[e*:esize] = element[esize-1:0];
end;

V{datasize}(d) = result;

URSQRTE

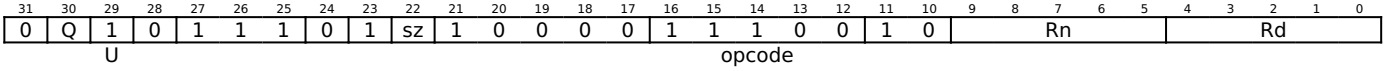
Unsigned reciprocal square root estimate

This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse square root for each value, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
URSQRTE <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let n : integer = UInt(Rn);

if sz == '1' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;

USDOT (by element)

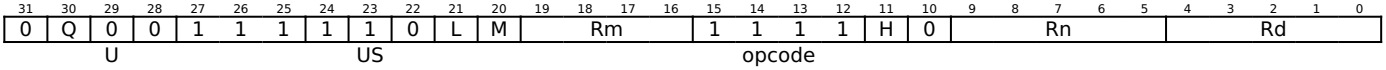
Dot product with unsigned and signed integers (vector, by element)

This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(FEAT_I8MM)



Encoding

```
USDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_I8MM) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(M::Rm);
let d : integer = UInt(Rd);
let i : integer = UInt(H::L);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV 32;
```

Assembler Symbols

USHL

Unsigned shift left (register)

This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

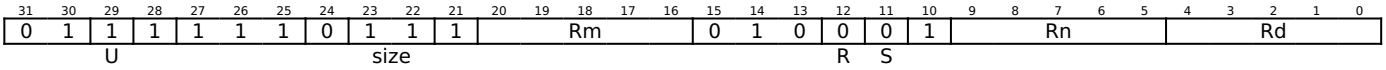
If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see *URSHL*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

USHLL, USHLL2

Unsigned shift left long (immediate)

This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

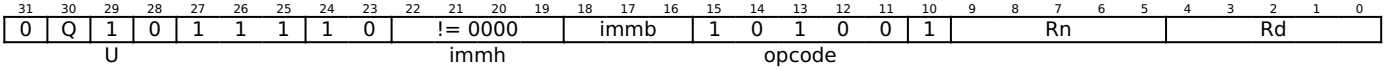
The `USHLL` instruction extracts vector elements from the lower half of the source register. The `USHLL2` instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias UXTL, UXTL2.

Vector

(FEAT_AdvSIMD)



Encoding

```
USHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] == '1' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << HighestSetBitNZ(immh[2:0]);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;

let shift : integer = UInt(immh::immb) - esize;
let unsigned : boolean = TRUE;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “immh”:

USHR

Unsigned shift right (immediate)

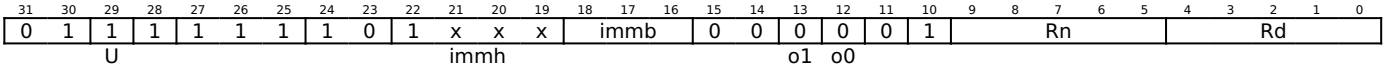
This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see *URSHR*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

```
USHR D<d>, D<n>, #<shift>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if immh[3] != '1' then EndOfDecode(Decode_UNDEF); end;

USMMLA (vector)

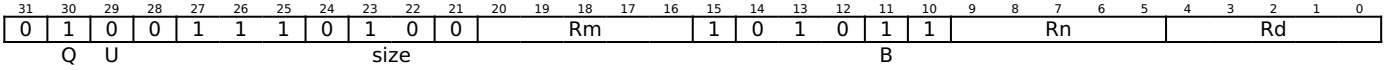
Unsigned and signed 8-bit integer matrix multiply-accumulate to 32-bit integer (vector)

This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.I8MM indicates whether this instruction is supported.

Vector

(FEAT_I8MM)



Encoding

```
USMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_I8MM) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
let op1_unsigned : boolean = TRUE;
let op2_unsigned : boolean = FALSE;
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(128) = V{}(n);
let operand2 : bits(128) = V{}(m);
let addend : bits(128)   = V{}(d);

V{128}(d) = MatMulAdd(addend, operand1, operand2, op1_unsigned, op2_unsigned);
```

Operational information

Arm expects that the USMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two USDOT (vector) instructions, with a goal that it should have significantly higher throughput.

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

USQADD

Unsigned saturating accumulate of signed value

This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

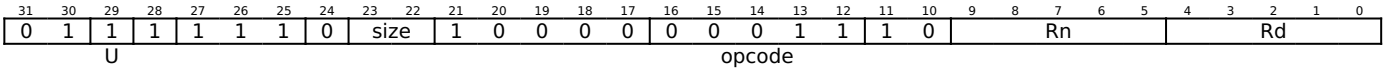
If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

(FEAT_AdvSIMD)



Encoding

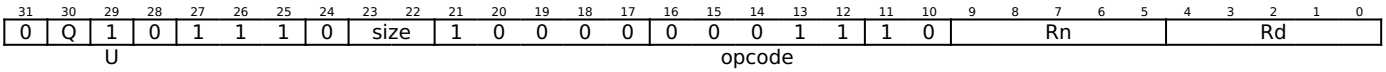
```
USQADD <V><d>, <V><n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = esize;
let elements : integer = 1;
let unsigned : boolean = TRUE;
```

Vector

(FEAT_AdvSIMD)



Encoding

```
USQADD <Vd>.<T>, <Vn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size::Q == '110' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
let unsigned : boolean = TRUE;
```

Assembler Symbols

USRA

Unsigned shift right and accumulate (immediate)

This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see *URSRA*.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

UXTL, UXTL2

Unsigned extend long

This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The `UXTL` instruction extracts vector elements from the lower half of the source register. The `UXTL2` instruction extracts vector elements from the upper half of the source register.

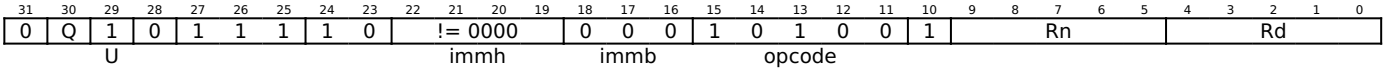
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of USHLL, USHLL2. This means:

- The encodings in this description are named to match the encodings of USHLL, USHLL2.
- The description of USHLL, USHLL2 gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Vector

(FEAT_AdvSIMD)



Encoding

```
UXTL{2} <Vd>.<Ta>, <Vn>.<Tb>
```

is equivalent to

```
USHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #0
```

and is the preferred disassembly when `BitCount(immh) == 1`.

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> — Is an arrangement specifier, encoded in “immh”:

immh	<Ta>
0001	8H
001x	4S
01xx	2D
1xxx	RESERVED

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> — Is an arrangement specifier, encoded in “(immh :: Q)”:

immh	Q	<Tb>
0001	0	8B
0001	1	16B

UZP1

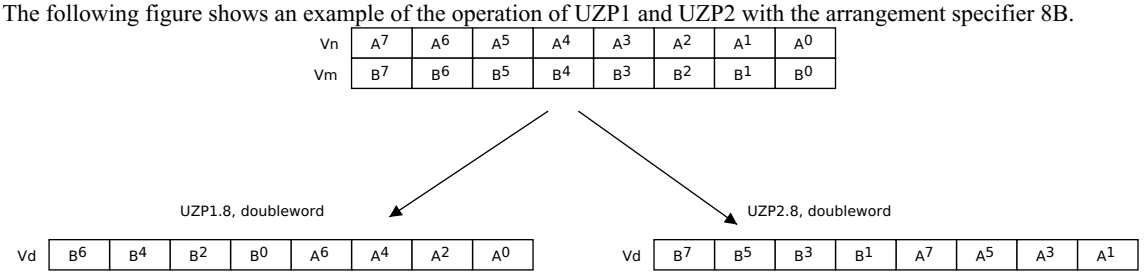
Unzip vectors (primary)

This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction can be used with `UZP2` to de-interleave two vectors.

The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.



Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

XAR

Exclusive-OR and rotate

This instruction performs a bitwise exclusive-OR between the 128-bit vector in the first source SIMD&FP register and the 128-bit vector in the second source SIMD&FP register, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

Advanced SIMD

(FEAT_SHA3)

Encoding

```
XAR <Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SHA3) then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);
```

Assembler Symbols

<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<imm6>	Is a rotation right, encoded in "imm6".

Operation

```
AArch64_CheckFPAdvSIMDEnabled();

let Vm : bits(128) = V{}(m);
let Vn : bits(128) = V{}(n);
let tmp : bits(128) = Vn XOR Vm;
V{128}(d) = ROR(tmp[127:64], UInt(imm6))::ROR(tmp[63:0], UInt(imm6));
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

XTN, XTN2

Extract narrow

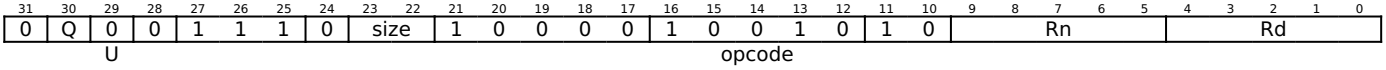
This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

The `XTN` instruction writes the vector to the lower half of the destination register and clears the upper half. The `XTN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_AdvSIMD)



Encoding

```
XTN{2} <Vd>.<Tb>, <Vn>.<Ta>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64;
let part : integer = UInt(Q);
let elements : integer = datasize DIV esize;
```

Assembler Symbols

2 — Is the second and upper half specifier. If present, it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> — Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> — Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> — Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> — Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand : bits(2*datasize) = V{}(n);
var result : bits(datasize);
var element : bits(2*esize);

for e = 0 to elements-1 do
    element = operand[e*:(2*esize)];
    result[e*:esize] = element[esize-1:0];
end;
Vpart{datasize}(d, part) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ZIP1

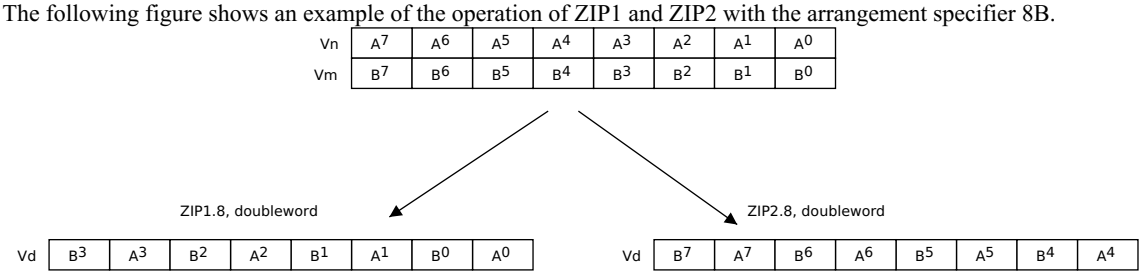
Zip vectors (primary)

This instruction reads adjacent vector elements from the lower half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

Note

This instruction can be used with `ZIP2` to interleave two vectors.

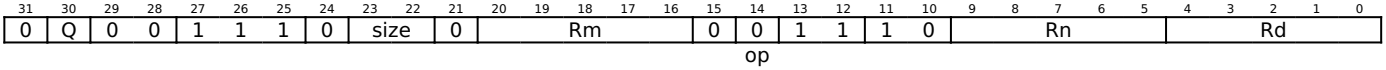
The following figure shows an example of the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.



Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

(FEAT_AdvSIMD)



Encoding

```
ZIP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AdvSIMD) then EndOfDecode(Decode_UNDEF); end;
if size::Q == '110' then EndOfDecode(Decode_UNDEF); end;

let d : integer{} = UInt(Rd);
let n : integer{} = UInt(Rn);
let m : integer{} = UInt(Rm);

let esize : integer{} = 8 << UInt(size);
let datasize : integer{} = 64 << UInt(Q);
let elements : integer = datasize DIV esize;
let part : integer = UInt(op);
let pairs : integer = elements DIV 2;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “(size :: Q)”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64_CheckFPAdvSIMDEnabled();
let operand1 : bits(datasize) = V{datasize}(n);
let operand2 : bits(datasize) = V{datasize}(m);
var result : bits(datasize);

let base : integer = part * pairs;

for p = 0 to pairs-1 do
    result[(2*p+0)*:esize] = operand1[(base+p)*:esize];
    result[(2*p+1)*:esize] = operand2[(base+p)*:esize];
end;

V{datasize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

A64 -- SVE Instructions (alphabetic order)

ABS: Absolute value (predicated).

ADCLB: Add with carry long (bottom).

ADCLT: Add with carry long (top).

ADD (immediate): Add immediate (unpredicated).

ADD (vectors, predicated): Add (predicated).

ADD (vectors, unpredicated): Add (unpredicated).

ADDHNB: Add narrow high part (bottom).

ADDHNT: Add narrow high part (top).

ADDP: Add pairwise.

ADDPL: Add multiple of predicate register size to scalar register.

ADDPT (predicated): Add checked pointer vectors (predicated).

ADDPT (unpredicated): Add checked pointer vectors (unpredicated).

ADDQP: Add pairwise within quadword vector segments (unpredicated).

ADDQV: Add reduction of quadword vector segments.

ADDSUBP: Add subtract pairwise.

ADDVL: Add multiple of vector register size to scalar register.

ADR: Calculate vector address.

AESD (indexed): Multi-vector AES single round decryption.

AESD (vectors): AES single round decryption.

AESDIMC: Multi-vector AES single round decryption and inverse mix columns.

AESE (indexed): Multi-vector AES single round encryption.

AESE (vectors): AES single round encryption.

AESEMC: Multi-vector AES single round encryption and mix columns.

AESIMC: AES inverse mix columns.

AESMC: AES mix columns.

AND (immediate): Bitwise AND with immediate (unpredicated).

AND (predicates): Bitwise AND predicates.

AND (vectors, predicated): Bitwise AND (predicated).

AND (vectors, unpredicated): Bitwise AND (unpredicated).

ANDQV: Bitwise AND reduction of quadword vector segments.

ANDS: Bitwise AND predicates, setting the condition flags.

ANDV: Bitwise AND reduction to scalar.

ASR (immediate, predicated): Arithmetic shift right by immediate (predicated).

ASR (immediate, unpredicated): Arithmetic shift right by immediate (unpredicated).

ASR (vectors): Arithmetic shift right by vector (predicated).

ASR (wide elements, predicated): Arithmetic shift right by 64-bit wide elements (predicated).

ASR (wide elements, unpredicated): Arithmetic shift right by 64-bit wide elements (unpredicated).

ASRD: Arithmetic shift right for divide by immediate (predicated).

ASRR: Reversed arithmetic shift right by vector (predicated).

BCAX: Bitwise clear and exclusive-OR.

BDEP: Scatter lower bits into positions selected by bitmask.

BEXT: Gather lower bits from positions selected by bitmask.

BF1CVT, BF2CVT: 8-bit floating-point convert to BFloat16.

BF1CVTLT, BF2CVTLT: 8-bit floating-point convert to BFloat16 (top).

BFADD (predicated): BFloat16 add (predicated).

BFADD (unpredicated): BFloat16 add (unpredicated).

BFCLAMP: BFloat16 clamp to minimum/maximum number.

BFCVT: Single-precision convert to BFloat16 (predicated).

BFCVTN: BFloat16 convert to interleaved 8-bit floating-point.

BFCVTNT: Single-precision convert to BFloat16 (top, predicated).

BFDOT (indexed): BFloat16 dot product by indexed element to single-precision.

BFDOT (vectors): BFloat16 dot product to single-precision.

BFMAX: BFloat16 maximum (predicated).

BFMAXNM: BFloat16 maximum number (predicated).

BFMIN: BFloat16 minimum (predicated).

BFMINNM: BFloat16 minimum number (predicated).

BFMLA (indexed): BFloat16 fused multiply-add by indexed element.

BFMLA (vectors): BFloat16 fused multiply-add.

BFMLALB (indexed): BFloat16 multiply-add by indexed element to single-precision (bottom).

BFMLALB (vectors): BFloat16 multiply-add to single-precision (bottom).

BFMLALT (indexed): BFloat16 multiply-add by indexed element to single-precision (top).

BFMLALT (vectors): BFloat16 multiply-add to single-precision (top).

BFMLS (indexed): BFloat16 fused multiply-subtract by indexed element.

BFMLS (vectors): BFloat16 fused multiply-subtract.

BFMLSLB (indexed): BFloat16 multiply-subtract by indexed element from single-precision (bottom).

BFMLSLB (vectors): BFloat16 multiply-subtract from single-precision (bottom).

BFMLSLT (indexed): BFloat16 multiply-subtract by indexed element from single-precision (top).

BFMLSLT (vectors): BFloat16 multiply-subtract from single-precision (top).

BFMMLA (non-widening): BFloat16 matrix multiply-accumulate.

BFMMLA (widening): BFloat16 matrix multiply-accumulate to single-precision.

BFMUL (indexed): BFloat16 multiply by indexed element.

BFMUL (vectors, predicated): BFloat16 multiply (predicated).

BFMUL (vectors, unpredicated): BFloat16 multiply (unpredicated).

BFSCALE: BFloat16 adjust exponent (predicated).

BFSUB (predicated): BFloat16 subtract (predicated).

BFSUB (unpredicated): BFloat16 subtract (unpredicated).

BGRP: Group bits to right or left as selected by bitmask.

BIC (immediate): Bitwise clear bits using immediate (unpredicated): an alias of AND (immediate).

BIC (predicates): Bitwise clear predicates.

BIC (vectors, predicated): Bitwise clear (predicated).

BIC (vectors, unpredicated): Bitwise clear (unpredicated).

BICS: Bitwise clear predicates, setting the condition flags.

BRKA: Break after first true condition.

BRKAS: Break after first true condition, setting the condition flags.

BRKB: Break before first true condition.

BRKBS: Break before first true condition, setting the condition flags.

BRKN: Propagate break to next partition.

BRKNS: Propagate break to next partition, setting the condition flags.

BRKPA: Break after first true condition, propagating from previous partition.

BRKPAS: Break after first true condition, propagating from previous partition and setting the condition flags.

BRKPB: Break before first true condition, propagating from previous partition.

BRKPBS: Break before first true condition, propagating from previous partition and setting the condition flags.

BSL: Bitwise select.

BSL1N: Bitwise select with first input inverted.

BSL2N: Bitwise select with second input inverted.

CADD: Complex integer add.

CDOT (indexed): Complex integer dot product by indexed element.

CDOT (vectors): Complex integer dot product.

CLASTA (scalar): Conditionally extract element after last to general-purpose register.

CLASTA (SIMD&FP scalar): Conditionally extract element after last to SIMD&FP scalar register.

CLASTA (vectors): Conditionally extract element after last to vector register.

CLASTB (scalar): Conditionally extract last element to general-purpose register.

CLASTB (SIMD&FP scalar): Conditionally extract last element to SIMD&FP scalar register.

CLASTB (vectors): Conditionally extract last element to vector register.

CLS: Count leading sign bits (predicated).

CLZ: Count leading zero bits (predicated).

CMLA (indexed): Complex integer multiply-add by indexed element.

CMLA (vectors): Complex integer multiply-add.

CMP<cc> (immediate): Compare vector to immediate.

CMP<cc> (vectors): Compare vectors.

CMP<cc> (wide elements): Compare vector to 64-bit wide elements.

CMPLE (vectors): Compare signed less than or equal to vector, setting the condition flags: an alias of CMP<cc> (vectors).

CMPLO (vectors): Compare unsigned lower than vector, setting the condition flags: an alias of CMP<cc> (vectors).

CMPLS (vectors): Compare unsigned lower than or same as vector, setting the condition flags: an alias of CMP<cc> (vectors).

CMPLT (vectors): Compare signed less than vector, setting the condition flags: an alias of CMP<cc> (vectors).

CNOT: Logically invert boolean condition (predicated).

CNT: Count nonzero bits (predicated).

CNTB, CNTD, CNTH, CNTW: Set scalar to multiple of predicate constraint element count.

CNTP (predicate as counter): Set scalar to count from predicate-as-counter.

CNTP (predicate): Set scalar to count of true predicate elements.

COMPACT: Copy Active vector elements to lower-numbered elements.

CPY (immediate, merging): Copy signed integer immediate to vector elements (merging).

CPY (immediate, zeroing): Copy signed integer immediate to vector elements (zeroing).

CPY (scalar): Copy general-purpose register to vector elements (predicated).

CPY (SIMD&FP scalar): Copy SIMD&FP scalar register to vector elements (predicated).

CTERMEQ, CTERMNE: Compare and terminate loop.

DECB, DECD, DECH, DECW (scalar): Decrement scalar by multiple of predicate constraint element count.

DECD, DECH, DECW (vector): Decrement vector by multiple of predicate constraint element count.

DECP (scalar): Decrement scalar by count of true predicate elements.

DECP (vector): Decrement vector by count of true predicate elements.

DUP (immediate): Broadcast signed immediate to vector elements (unpredicated).

DUP (indexed): Broadcast indexed element to vector (unpredicated).

DUP (scalar): Broadcast general-purpose register to vector elements (unpredicated).

DUPM: Broadcast logical bitmask immediate to vector (unpredicated).

DUPQ: Broadcast indexed element within each quadword vector segment (unpredicated).

EON: Bitwise exclusive-OR with inverted immediate (unpredicated): an alias of EOR (immediate).

EOR (immediate): Bitwise exclusive-OR with immediate (unpredicated).

EOR (predicates): Bitwise exclusive-OR predicates.

EOR (vectors, predicated): Bitwise exclusive-OR (predicated).

EOR (vectors, unpredicated): Bitwise exclusive-OR (unpredicated).

EOR3: Bitwise exclusive-OR between three vectors.

EORBT: Interleaving exclusive-OR (bottom, top).

EORQV: Bitwise exclusive-OR reduction of quadword vector segments.

EORS: Bitwise exclusive-OR predicates, setting the condition flags.

EORTB: Interleaving exclusive-OR (top, bottom).

EORV: Bitwise exclusive-OR reduction to scalar.

EXPAND: Copy lower-numbered vector elements to Active elements.

EXT: Extract vector from pair of vectors.

EXTQ: Extract vector segment from each pair of quadword vector segments.

F1CVT, F2CVT: 8-bit floating-point convert to half-precision.

F1CVTLT, F2CVTLT: 8-bit floating-point convert to half-precision (top).

FABD: Floating-point absolute difference (predicated).

FABS: Floating-point absolute value (predicated).

FAC<cc>: Floating-point absolute compare.

FACLE: Floating-point absolute compare less than or equal: an alias of FAC<cc>.

FACLT: Floating-point absolute compare less than: an alias of FAC<cc>.

FADD (immediate): Floating-point add immediate (predicated).

FADD (vectors, predicated): Floating-point add (predicated).

FADD (vectors, unpredicated): Floating-point add (unpredicated).

FADDA: Floating-point add strictly-ordered reduction, accumulating in scalar.

FADDP: Floating-point add pairwise.

FADDQV: Floating-point add recursive reduction of quadword vector segments.

FADDV: Floating-point add recursive reduction to scalar.

FAMAX: Floating-point absolute maximum (predicated).

FAMIN: Floating-point absolute minimum (predicated).

FCADD: Floating-point complex add (predicated).

FCLAMP: Floating-point clamp to minimum/maximum number.

FCM<cc> (vectors): Floating-point compare.

FCM<cc> (zero): Floating-point compare with zero.

FCMLA (indexed): Floating-point complex multiply-add by indexed element.

FCMLA (vectors): Floating-point complex multiply-add (predicated).

FCMLE (vectors): Floating-point compare less than or equal to vector: an alias of FCM<cc> (vectors).

FCMLT (vectors): Floating-point compare less than vector: an alias of FCM<cc> (vectors).

FCPY: Copy floating-point immediate to vector elements (predicated).

FCVT: Floating-point convert (predicated).

FCVTLT: Floating-point widening convert (top, predicated).

FCVTN: Half-precision convert to interleaved 8-bit floating-point.

FCVTNB: Single-precision convert to interleaved 8-bit floating-point (bottom).

FCVTNT (predicated): Floating-point narrowing convert (top, predicated).

FCVTNT (unpredicated): Single-precision convert to interleaved 8-bit floating-point (top).

FCVTX: Double-precision convert to single-precision, rounding to odd (predicated).

FCVTXNT: Double-precision convert to single-precision, rounding to odd (top, predicated).

FCVTZS: Floating-point convert to signed integer, rounding toward zero (predicated).

FCVTZSN: Floating-point narrowing convert to interleaved signed integer, rounding toward zero.

FCVTZU: Floating-point convert to unsigned integer, rounding toward zero (predicated).

FCVTZUN: Floating-point narrowing convert to interleaved unsigned integer, rounding toward zero.

FDIV: Floating-point divide (predicated).

FDIVR: Floating-point reversed divide (predicated).

FDOT (2-way, indexed, FP16 to FP32): Half-precision dot product by indexed element to single-precision.

FDOT (2-way, indexed, FP8 to FP16): 8-bit floating-point dot product by indexed element to half-precision.

FDOT (2-way, vectors, FP16 to FP32): Half-precision dot product to single-precision.

FDOT (2-way, vectors, FP8 to FP16): 8-bit floating-point dot product to half-precision.

FDOT (4-way, indexed): 8-bit floating-point dot product by indexed element to single-precision.

FDOT (4-way, vectors): 8-bit floating-point dot product to single-precision.

FDUP: Broadcast floating-point immediate to vector elements (unpredicated).

FEXPA: Floating-point exponential accelerator.

FIRSTP: Scalar index of first true predicate element (predicated).

FLOGB: Floating-point base 2 logarithm as integer.

FMAD: Floating-point fused multiply-add to multiplicand (predicated).

FMAX (immediate): Floating-point maximum with immediate (predicated).

FMAX (vectors): Floating-point maximum (predicated).

FMAXNM (immediate): Floating-point maximum number with immediate (predicated).

FMAXNM (vectors): Floating-point maximum number (predicated).

FMAXNMP: Floating-point maximum number pairwise.

FMAXNMQV: Floating-point maximum number recursive reduction of quadword vector segments.

FMAXNMV: Floating-point maximum number recursive reduction to scalar.

FMAXP: Floating-point maximum pairwise.

FMAXQV: Floating-point maximum reduction of quadword vector segments.

FMAXV: Floating-point maximum recursive reduction to scalar.

FMIN (immediate): Floating-point minimum with immediate (predicated).

FMIN (vectors): Floating-point minimum (predicated).

FMINNM (immediate): Floating-point minimum number with immediate (predicated).

FMINNM (vectors): Floating-point minimum number (predicated).

FMINNMP: Floating-point minimum number pairwise.

FMINNMQV: Floating-point minimum number recursive reduction of quadword vector segments.

FMINNMV: Floating-point minimum number recursive reduction to scalar.

FMINP: Floating-point minimum pairwise.

FMINQV: Floating-point minimum recursive reduction of quadword vector segments.

FMINV: Floating-point minimum recursive reduction to scalar.

FMLA (indexed): Floating-point fused multiply-add by indexed element.

FMLA (vectors): Floating-point fused multiply-add (predicated).

FMLALB (indexed, FP16 to FP32): Half-precision multiply-add by indexed element to single-precision (bottom).

FMLALB (indexed, FP8 to FP16): 8-bit floating-point multiply-add by indexed element to half-precision (bottom).

FMLALB (vectors, FP16 to FP32): Half-precision multiply-add to single-precision (bottom).

FMLALB (vectors, FP8 to FP16): 8-bit floating-point multiply-add to half-precision (bottom).

FMLALLBB (indexed): 8-bit floating-point multiply-add by indexed element to single-precision (bottom bottom).

FMLALLBB (vectors): 8-bit floating-point multiply-add to single-precision (bottom bottom).

FMLALLBT (indexed): 8-bit floating-point multiply-add by indexed element to single-precision (bottom top).

FMLALLBT (vectors): 8-bit floating-point multiply-add to single-precision (bottom top).

FMLALLTB (indexed): 8-bit floating-point multiply-add by indexed element to single-precision (top bottom).

FMLALLTB (vectors): 8-bit floating-point multiply-add to single-precision (top bottom).

FMLALLTT (indexed): 8-bit floating-point multiply-add by indexed element to single-precision (top top).

FMLALLTT (vectors): 8-bit floating-point multiply-add to single-precision (top top).

FMLALT (indexed, FP16 to FP32): Half-precision multiply-add by indexed element to single-precision (top).

FMLALT (indexed, FP8 to FP16): 8-bit floating-point multiply-add by indexed element to half-precision (top).

FMLALT (vectors, FP16 to FP32): Half-precision multiply-add to single-precision (top).

FMLALT (vectors, FP8 to FP16): 8-bit floating-point multiply-add to half-precision (top).

FMLS (indexed): Floating-point fused multiply-subtract by indexed element.

FMLS (vectors): Floating-point fused multiply-subtract (predicated).

FMLSLB (indexed): Half-precision multiply-subtract by indexed element from single-precision (bottom).

FMLSLB (vectors): Half-precision multiply-subtract from single-precision (bottom).

FMLSLT (indexed): Half-precision multiply-subtract by indexed element from single-precision (top).

FMLSLT (vectors): Half-precision multiply-subtract from single-precision (top).

FMMLA (non-widening): Floating-point matrix multiply-accumulate.

FMMLA (widening, FP16 to FP32): Half-precision matrix multiply-accumulate to single-precision.

FMMLA (widening, FP8 to FP16): 8-bit floating-point matrix multiply-accumulate to half-precision.

FMMLA (widening, FP8 to FP32): 8-bit floating-point matrix multiply-accumulate to single-precision.

FMOV (immediate, predicated): Move floating-point immediate to vector elements (predicated): an alias of FCPY.

FMOV (immediate, unpredicated): Move floating-point immediate to vector elements (unpredicated): an alias of FDUP.

FMOV (zero, predicated): Move floating-point +0.0 to vector elements (predicated): an alias of CPY (immediate, merging).

FMOV (zero, unpredicated): Move floating-point +0.0 to vector elements (unpredicated): an alias of DUP (immediate).

FMSB: Floating-point fused multiply-subtract to multiplicand (predicated).

FMUL (immediate): Floating-point multiply by immediate (predicated).

FMUL (indexed): Floating-point multiply by indexed element.

FMUL (vectors, predicated): Floating-point multiply (predicated).

FMUL (vectors, unpredicated): Floating-point multiply (unpredicated).

FMULX: Floating-point multiply extended (predicated).

FNEG: Floating-point negate (predicated).

FNMAD: Floating-point negated fused multiply-add to multiplicand (predicated).

FNMLA: Floating-point negated fused multiply-add (predicated).

FNMLS: Floating-point negated fused multiply-subtract (predicated).

FNMSB: Floating-point negated fused multiply-subtract to multiplicand (predicated).

FRECPE: Floating-point reciprocal estimate (unpredicated).

FRECPS: Floating-point reciprocal step (unpredicated).

FRECPX: Floating-point reciprocal exponent (predicated).

FRINT32X: Floating-point round to 32-bit integer (predicated).

FRINT32Z: Floating-point round to 32-bit integer, rounding toward zero (predicated).

FRINT64X: Floating-point round to 64-bit integer (predicated).

FRINT64Z: Floating-point round to 64-bit integer, rounding toward zero (predicated).

FRINT<r>: Floating-point round to integral value (predicated).

FRSQRTE: Floating-point reciprocal square root estimate (unpredicated).

FRSQRTS: Floating-point reciprocal square root step (unpredicated).

FSCALE: Floating-point adjust exponent (predicated).

FSQRT: Floating-point square root (predicated).

FSUB (immediate): Floating-point subtract immediate (predicated).

FSUB (vectors, predicated): Floating-point subtract (predicated).

FSUB (vectors, unpredicated): Floating-point subtract (unpredicated).

FSUBR (immediate): Floating-point reversed subtract from immediate (predicated).

FSUBR (vectors): Floating-point reversed subtract (predicated).

FTMAD: Floating-point trigonometric multiply-add coefficient.

FTSMUL: Floating-point trigonometric starting value.

FTSSEL: Floating-point trigonometric select coefficient.

HISTCNT: Count matching elements in vector.

HISTSEG: Count matching elements in vector segments.

INCB, INCD, INCH, INCW (scalar): Increment scalar by multiple of predicate constraint element count.

INCD, INCH, INCW (vector): Increment vector by multiple of predicate constraint element count.

INCP (scalar): Increment scalar by count of true predicate elements.

INCP (vector): Increment vector by count of true predicate elements.

INDEX (immediate, scalar): Create index starting from immediate and incremented by general-purpose register.

INDEX (immediates): Create index starting from and incremented by immediate.

INDEX (scalar, immediate): Create index starting from general-purpose register and incremented by immediate.

INDEX (scalars): Create index starting from and incremented by general-purpose register.

INSR (scalar): Insert general-purpose register in shifted vector.

INSR (SIMD&FP scalar): Insert SIMD&FP scalar register in shifted vector.

LASTA (scalar): Extract element after last to general-purpose register.

LASTA (SIMD&FP scalar): Extract element after last to SIMD&FP scalar register.

LASTB (scalar): Extract last element to general-purpose register.

LASTB (SIMD&FP scalar): Extract last element to SIMD&FP scalar register.

LASTP: Scalar index of last true predicate element (predicated).

LD1B (scalar plus immediate, consecutive registers): Contiguous load of bytes to multiple consecutive vectors (immediate index).

LD1B (scalar plus immediate, single register): Contiguous load unsigned bytes to vector (immediate index).

LD1B (scalar plus scalar, consecutive registers): Contiguous load of bytes to multiple consecutive vectors (scalar index).

LD1B (scalar plus scalar, single register): Contiguous load unsigned bytes to vector (scalar index).

LD1B (scalar plus vector): Gather load unsigned bytes to vector (vector index).

LD1B (vector plus immediate): Gather load unsigned bytes to vector (immediate index).

LD1D (scalar plus immediate, consecutive registers): Contiguous load of doublewords to multiple consecutive vectors (immediate index).

LD1D (scalar plus immediate, single register): Contiguous load unsigned doublewords to vector (immediate index).

LD1D (scalar plus scalar, consecutive registers): Contiguous load of doublewords to multiple consecutive vectors (scalar index).

LD1D (scalar plus scalar, single register): Contiguous load unsigned doublewords to vector (scalar index).

LD1D (scalar plus vector): Gather load doublewords to vector (vector index).

LD1D (vector plus immediate): Gather load doublewords to vector (immediate index).

LD1H (scalar plus immediate, consecutive registers): Contiguous load of halfwords to multiple consecutive vectors (immediate index).

LD1H (scalar plus immediate, single register): Contiguous load unsigned halfwords to vector (immediate index).

LD1H (scalar plus scalar, consecutive registers): Contiguous load of halfwords to multiple consecutive vectors (scalar index).

LD1H (scalar plus scalar, single register): Contiguous load unsigned halfwords to vector (scalar index).

LD1H (scalar plus vector): Gather load unsigned halfwords to vector (vector index).

LD1H (vector plus immediate): Gather load unsigned halfwords to vector (immediate index).

LD1Q: Gather load quadwords.

LD1RB: Load and broadcast unsigned byte to vector.

LD1RD: Load and broadcast doubleword to vector.

LD1RH: Load and broadcast unsigned halfword to vector.

LD1ROB (scalar plus immediate): Contiguous load and replicate thirty-two bytes (immediate index).

LD1ROB (scalar plus scalar): Contiguous load and replicate thirty-two bytes (scalar index).

LD1ROD (scalar plus immediate): Contiguous load and replicate four doublewords (immediate index).

LD1ROD (scalar plus scalar): Contiguous load and replicate four doublewords (scalar index).

LD1ROH (scalar plus immediate): Contiguous load and replicate sixteen halfwords (immediate index).

LD1ROH (scalar plus scalar): Contiguous load and replicate sixteen halfwords (scalar index).

LD1ROW (scalar plus immediate): Contiguous load and replicate eight words (immediate index).

LD1ROW (scalar plus scalar): Contiguous load and replicate eight words (scalar index).

LD1RQB (scalar plus immediate): Contiguous load and replicate sixteen bytes (immediate index).

LD1RQB (scalar plus scalar): Contiguous load and replicate sixteen bytes (scalar index).

LD1RQD (scalar plus immediate): Contiguous load and replicate two doublewords (immediate index).

LD1RQD (scalar plus scalar): Contiguous load and replicate two doublewords (scalar index).

LD1RQH (scalar plus immediate): Contiguous load and replicate eight halfwords (immediate index).

LD1RQH (scalar plus scalar): Contiguous load and replicate eight halfwords (scalar index).

LD1RQW (scalar plus immediate): Contiguous load and replicate four words (immediate index).

LD1RQW (scalar plus scalar): Contiguous load and replicate four words (scalar index).

LD1RSB: Load and broadcast signed byte to vector.

LD1RSH: Load and broadcast signed halfword to vector.

LD1RSW: Load and broadcast signed word to vector.

LD1RW: Load and broadcast unsigned word to vector.

LD1SB (scalar plus immediate): Contiguous load signed bytes to vector (immediate index).

LD1SB (scalar plus scalar): Contiguous load signed bytes to vector (scalar index).

LD1SB (scalar plus vector): Gather load signed bytes to vector (vector index).

LD1SB (vector plus immediate): Gather load signed bytes to vector (immediate index).

LD1SH (scalar plus immediate): Contiguous load signed halfwords to vector (immediate index).

LD1SH (scalar plus scalar): Contiguous load signed halfwords to vector (scalar index).

LD1SH (scalar plus vector): Gather load signed halfwords to vector (vector index).

LD1SH (vector plus immediate): Gather load signed halfwords to vector (immediate index).

LD1SW (scalar plus immediate): Contiguous load signed words to vector (immediate index).

LD1SW (scalar plus scalar): Contiguous load signed words to vector (scalar index).

LD1SW (scalar plus vector): Gather load signed words to vector (vector index).

LD1SW (vector plus immediate): Gather load signed words to vector (immediate index).

LD1W (scalar plus immediate, consecutive registers): Contiguous load of words to multiple consecutive vectors (immediate index).

LD1W (scalar plus immediate, single register): Contiguous load unsigned words to vector (immediate index).

LD1W (scalar plus scalar, consecutive registers): Contiguous load of words to multiple consecutive vectors (scalar index).

LD1W (scalar plus scalar, single register): Contiguous load unsigned words to vector (scalar index).

LD1W (scalar plus vector): Gather load unsigned words to vector (vector index).

LD1W (vector plus immediate): Gather load unsigned words to vector (immediate index).

LD2B (scalar plus immediate): Contiguous load two-byte structures to two vectors (immediate index).

LD2B (scalar plus scalar): Contiguous load two-byte structures to two vectors (scalar index).

LD2D (scalar plus immediate): Contiguous load two-doubleword structures to two vectors (immediate index).

LD2D (scalar plus scalar): Contiguous load two-doubleword structures to two vectors (scalar index).

LD2H (scalar plus immediate): Contiguous load two-halfword structures to two vectors (immediate index).

LD2H (scalar plus scalar): Contiguous load two-halfword structures to two vectors (scalar index).

LD2Q (scalar plus immediate): Contiguous load two-quadword structures to two vectors (immediate index).

LD2Q (scalar plus scalar): Contiguous load two-quadword structures to two vectors (scalar index).

LD2W (scalar plus immediate): Contiguous load two-word structures to two vectors (immediate index).

LD2W (scalar plus scalar): Contiguous load two-word structures to two vectors (scalar index).

LD3B (scalar plus immediate): Contiguous load three-byte structures to three vectors (immediate index).

LD3B (scalar plus scalar): Contiguous load three-byte structures to three vectors (scalar index).

LD3D (scalar plus immediate): Contiguous load three-doubleword structures to three vectors (immediate index).

LD3D (scalar plus scalar): Contiguous load three-doubleword structures to three vectors (scalar index).

LD3H (scalar plus immediate): Contiguous load three-halfword structures to three vectors (immediate index).

LD3H (scalar plus scalar): Contiguous load three-halfword structures to three vectors (scalar index).

LD3Q (scalar plus immediate): Contiguous load three-quadword structures to three vectors (immediate index).

LD3Q (scalar plus scalar): Contiguous load three-quadword structures to three vectors (scalar index).

LD3W (scalar plus immediate): Contiguous load three-word structures to three vectors (immediate index).

LD3W (scalar plus scalar): Contiguous load three-word structures to three vectors (scalar index).

LD4B (scalar plus immediate): Contiguous load four-byte structures to four vectors (immediate index).

LD4B (scalar plus scalar): Contiguous load four-byte structures to four vectors (scalar index).

LD4D (scalar plus immediate): Contiguous load four-doubleword structures to four vectors (immediate index).

LD4D (scalar plus scalar): Contiguous load four-doubleword structures to four vectors (scalar index).

LD4H (scalar plus immediate): Contiguous load four-halfword structures to four vectors (immediate index).

LD4H (scalar plus scalar): Contiguous load four-halfword structures to four vectors (scalar index).

LD4Q (scalar plus immediate): Contiguous load four-quadword structures to four vectors (immediate index).

LD4Q (scalar plus scalar): Contiguous load four-quadword structures to four vectors (scalar index).

LD4W (scalar plus immediate): Contiguous load four-word structures to four vectors (immediate index).

LD4W (scalar plus scalar): Contiguous load four-word structures to four vectors (scalar index).

LDAPRO: Load-Acquire RCpc octaword.

LDFF1B (scalar plus scalar): Contiguous load first-fault unsigned bytes to vector (scalar index).

LDFF1B (scalar plus vector): Gather load first-fault unsigned bytes to vector (vector index).

LDFF1B (vector plus immediate): Gather load first-fault unsigned bytes to vector (immediate index).

LDFF1D (scalar plus scalar): Contiguous load first-fault doublewords to vector (scalar index).

LDFF1D (scalar plus vector): Gather load first-fault doublewords to vector (vector index).

LDFF1D (vector plus immediate): Gather load first-fault doublewords to vector (immediate index).

LDFF1H (scalar plus scalar): Contiguous load first-fault unsigned halfwords to vector (scalar index).

LDFF1H (scalar plus vector): Gather load first-fault unsigned halfwords to vector (vector index).

LDFF1H (vector plus immediate): Gather load first-fault unsigned halfwords to vector (immediate index).

LDFF1SB (scalar plus scalar): Contiguous load first-fault signed bytes to vector (scalar index).

LDFF1SB (scalar plus vector): Gather load first-fault signed bytes to vector (vector index).

LDFF1SB (vector plus immediate): Gather load first-fault signed bytes to vector (immediate index).

LDFF1SH (scalar plus scalar): Contiguous load first-fault signed halfwords to vector (scalar index).

LDFF1SH (scalar plus vector): Gather load first-fault signed halfwords to vector (vector index).

LDFF1SH (vector plus immediate): Gather load first-fault signed halfwords to vector (immediate index).

LDFF1SW (scalar plus scalar): Contiguous load first-fault signed words to vector (scalar index).

LDFF1SW (scalar plus vector): Gather load first-fault signed words to vector (vector index).

LDFF1SW (vector plus immediate): Gather load first-fault signed words to vector (immediate index).

LDFF1W (scalar plus scalar): Contiguous load first-fault unsigned words to vector (scalar index).

LDFF1W (scalar plus vector): Gather load first-fault unsigned words to vector (vector index).

LDFF1W (vector plus immediate): Gather load first-fault unsigned words to vector (immediate index).

LDNF1B: Contiguous load non-fault unsigned bytes to vector (immediate index).

LDNF1D: Contiguous load non-fault doublewords to vector (immediate index).

LDNF1H: Contiguous load non-fault unsigned halfwords to vector (immediate index).

LDNF1SB: Contiguous load non-fault signed bytes to vector (immediate index).

LDNF1SH: Contiguous load non-fault signed halfwords to vector (immediate index).

LDNF1SW: Contiguous load non-fault signed words to vector (immediate index).

LDNF1W: Contiguous load non-fault unsigned words to vector (immediate index).

LDNT1B (scalar plus immediate, consecutive registers): Contiguous load non-temporal of bytes to multiple consecutive vectors (immediate index).

LDNT1B (scalar plus immediate, single register): Contiguous load non-temporal bytes to vector (immediate index).

LDNT1B (scalar plus scalar, consecutive registers): Contiguous load non-temporal of bytes to multiple consecutive vectors (scalar index).

LDNT1B (scalar plus scalar, single register): Contiguous load non-temporal bytes to vector (scalar index).

LDNT1B (vector plus scalar): Gather load non-temporal unsigned bytes.

LDNT1D (scalar plus immediate, consecutive registers): Contiguous load non-temporal of doublewords to multiple consecutive vectors (immediate index).

LDNT1D (scalar plus immediate, single register): Contiguous load non-temporal doublewords to vector (immediate index).

LDNT1D (scalar plus scalar, consecutive registers): Contiguous load non-temporal of doublewords to multiple consecutive vectors (scalar index).

LDNT1D (scalar plus scalar, single register): Contiguous load non-temporal doublewords to vector (scalar index).

LDNT1D (vector plus scalar): Gather load non-temporal unsigned doublewords.

LDNT1H (scalar plus immediate, consecutive registers): Contiguous load non-temporal of halfwords to multiple consecutive vectors (immediate index).

LDNT1H (scalar plus immediate, single register): Contiguous load non-temporal halfwords to vector (immediate index).

LDNT1H (scalar plus scalar, consecutive registers): Contiguous load non-temporal of halfwords to multiple consecutive vectors (scalar index).

LDNT1H (scalar plus scalar, single register): Contiguous load non-temporal halfwords to vector (scalar index).

LDNT1H (vector plus scalar): Gather load non-temporal unsigned halfwords.

LDNT1SB: Gather load non-temporal signed bytes.

LDNT1SH: Gather load non-temporal signed halfwords.

LDNT1SW: Gather load non-temporal signed words.

LDNT1W (scalar plus immediate, consecutive registers): Contiguous load non-temporal of words to multiple consecutive vectors (immediate index).

LDNT1W (scalar plus immediate, single register): Contiguous load non-temporal words to vector (immediate index).

LDNT1W (scalar plus scalar, consecutive registers): Contiguous load non-temporal of words to multiple consecutive vectors (scalar index).

LDNT1W (scalar plus scalar, single register): Contiguous load non-temporal words to vector (scalar index).

LDNT1W (vector plus scalar): Gather load non-temporal unsigned words.

LDR (predicate): Load predicate register.

LDR (vector): Load vector register.

LSL (immediate, predicated): Logical shift left by immediate (predicated).

LSL (immediate, unpredicated): Logical shift left by immediate (unpredicated).

LSL (vectors): Logical shift left by vector (predicated).

LSL (wide elements, predicated): Logical shift left by 64-bit wide elements (predicated).

LSL (wide elements, unpredicated): Logical shift left by 64-bit wide elements (unpredicated).

LSLR: Reversed logical shift left by vector (predicated).

LSR (immediate, predicated): Logical shift right by immediate (predicated).

LSR (immediate, unpredicated): Logical shift right by immediate (unpredicated).

LSR (vectors): Logical shift right by vector (predicated).

LSR (wide elements, predicated): Logical shift right by 64-bit wide elements (predicated).

LSR (wide elements, unpredicated): Logical shift right by 64-bit wide elements (unpredicated).

LSRR: Reversed logical shift right by vector (predicated).

LUTI2 (8-bit and 16-bit): Lookup table read with 2-bit indices (8-bit and 16-bit).

LUTI4 (8-bit and 16-bit): Lookup table read with 4-bit indices (8-bit and 16-bit).

LUTI6 (16-bit): Lookup table read with 6-bit indices (16-bit).

LUTI6 (8-bit): Lookup table read with 6-bit indices (8-bit).

MAD: Multiply-add to multiplicand (predicated).

MADPT: Multiply-add checked pointer vectors to multiplicand.

MATCH: Detect any matching elements within quadwords, setting the condition flags.

MLA (indexed): Multiply-add by indexed element.

MLA (vectors): Multiply-add (predicated).

MLAPT: Multiply-add checked pointer vectors.

MLS (indexed): Multiply-subtract by indexed element.

MLS (vectors): Multiply-subtract (predicated).

MOV: Move logical bitmask immediate to vector (unpredicated): an alias of DUPM.

MOV: Move predicate (unpredicated): an alias of ORR (predicates).

MOV (immediate, merging): Move signed integer immediate to vector elements (merging): an alias of CPY (immediate, merging).

MOV (immediate, unpredicated): Move signed immediate to vector elements (unpredicated): an alias of DUP (immediate).

MOV (immediate, zeroing): Move signed integer immediate to vector elements (zeroing): an alias of CPY (immediate, zeroing).

MOV (predicate, merging): Move predicates (merging): an alias of SEL (predicates).

MOV (predicate, zeroing): Move predicates (zeroing): an alias of AND (predicates).

MOV (scalar, predicated): Move general-purpose register to vector elements (predicated): an alias of CPY (scalar).

MOV (scalar, unpredicated): Move general-purpose register to vector elements (unpredicated): an alias of DUP (scalar).

MOV (SIMD&FP scalar, predicated): Move SIMD&FP scalar register to vector elements (predicated): an alias of CPY (SIMD&FP scalar).

MOV (SIMD&FP scalar, unpredicated): Move indexed element or SIMD&FP scalar to vector (unpredicated): an alias of DUP (indexed).

MOV (vector, predicated): Move vector elements (predicated): an alias of SEL (vectors).

MOV (vector, unpredicated): Move vector register (unpredicated): an alias of ORR (vectors, unpredicated).

MOVPRFX (predicated): Move prefix (predicated).

MOVPRFX (unpredicated): Move prefix (unpredicated).

MOVS (predicated): Move predicates (zeroing), setting the condition flags: an alias of ANDS.

MOVS (unpredicated): Move predicate (unpredicated), setting the condition flags: an alias of ORRS.

MSB: Multiply-subtract to multiplicand.

MUL (immediate): Multiply by immediate (unpredicated).

MUL (indexed): Multiply by indexed element.

MUL (vectors, predicated): Multiply (predicated).

MUL (vectors, unpredicated): Multiply (unpredicated).

NAND: Bitwise NAND predicates.

NANDS: Bitwise NAND predicates, setting the condition flags.

NBSL: Bitwise inverted select.

NEG: Negate (predicated).

NMATCH: Detect no matching elements within quadwords, setting the condition flags.

NOR: Bitwise NOR predicates.

NORS: Bitwise NOR predicates, setting the condition flags.

NOT (predicate): Bitwise invert predicate: an alias of EOR (predicates).

NOT (vector): Bitwise invert (predicated).

NOTS: Bitwise invert predicate, setting the condition flags: an alias of EORS.

ORN (immediate): Bitwise inclusive OR with inverted immediate (unpredicated): an alias of ORR (immediate).

ORN (predicates): Bitwise inclusive OR inverted predicate.

ORNS: Bitwise inclusive OR inverted predicate, setting the condition flags.

ORQV: Bitwise inclusive OR reduction of quadword vector segments.

ORR (immediate): Bitwise inclusive OR with immediate (unpredicated).

ORR (predicates): Bitwise inclusive OR predicates.

ORR (vectors, predicated): Bitwise inclusive OR (predicated).

ORR (vectors, unpredicated): Bitwise inclusive OR (unpredicated).

ORRS: Bitwise inclusive OR predicates, setting the condition flags.

ORV: Bitwise inclusive OR reduction to scalar.

PEXT (predicate pair): Predicate extract pair from predicate-as-counter.

PEXT (predicate): Predicate extract from predicate-as-counter.

PFALSE: Set all predicate elements to false.

PFIRST: Set the First active predicate element to true.

PMLAL: Multi-vector polynomial multiply long and accumulate.

PMOV (to predicate): Move predicate from vector.

PMOV (to vector): Move predicate to vector.

PMUL: Polynomial multiply (unpredicated).

PMULL: Multi-vector polynomial multiply long.

PMULLB: Polynomial multiply long (bottom).

PMULLT: Polynomial multiply long (top).

PNEXT: Find next active predicate.

PRFB (scalar plus immediate): Contiguous prefetch bytes (immediate index).

PRFB (scalar plus scalar): Contiguous prefetch bytes (scalar index).

PRFB (scalar plus vector): Gather prefetch bytes (scalar plus vector).

PRFB (vector plus immediate): Gather prefetch bytes (vector plus immediate).

PRFD (scalar plus immediate): Contiguous prefetch doublewords (immediate index).

PRFD (scalar plus scalar): Contiguous prefetch doublewords (scalar index).

PRFD (scalar plus vector): Gather prefetch doublewords (scalar plus vector).

PRFD (vector plus immediate): Gather prefetch doublewords (vector plus immediate).

PRFH (scalar plus immediate): Contiguous prefetch halfwords (immediate index).

PRFH (scalar plus scalar): Contiguous prefetch halfwords (scalar index).

PRFH (scalar plus vector): Gather prefetch halfwords (scalar plus vector).

PRFH (vector plus immediate): Gather prefetch halfwords (vector plus immediate).

PRFW (scalar plus immediate): Contiguous prefetch words (immediate index).

PRFW (scalar plus scalar): Contiguous prefetch words (scalar index).

PRFW (scalar plus vector): Gather prefetch words (scalar plus vector).

PRFW (vector plus immediate): Gather prefetch words (vector plus immediate).

PSEL: Predicate select between predicate register or all-false.

PTEST: Set condition flags for predicate.

PTRUE (predicate as counter): Initialize predicate-as-counter to all active.

PTRUE (predicate): Initialize predicate from named constraint.

PTRUES: Initialize predicate from named constraint and set the condition flags.

PUNPKHI, PUNPKLO: Unpack and widen half of predicate.

RADDHNB: Rounding add narrow high part (bottom).

RADDHNT: Rounding add narrow high part (top).

RAX1: Bitwise rotate left by 1 and exclusive-OR.

RBIT: Reverse bits (predicated).

RDFFR (predicated): Return predicate of successfully loaded elements.

RDFFR (unpredicated): Read the first-fault register.

RDFFRS: Return predicate of successfully loaded elements, setting the condition flags.

RDVL: Read multiple of vector register size to scalar register.

REV (predicate): Reverse all elements in a predicate.

REV (vector): Reverse all elements in a vector (unpredicated).

REVB, REVH, REVW: Reverse bytes / halfwords / words within elements (predicated).

REVD: Reverse 64-bit doublewords in elements (predicated).

RSHRNB: Rounding shift right narrow by immediate (bottom).

RSHRNT: Rounding shift right narrow by immediate (top).

RSUBHNB: Rounding subtract narrow high part (bottom).

RSUBHNT: Rounding subtract narrow high part (top).

SABA: Signed absolute difference and accumulate.

SABAL: Two-way signed absolute difference sum and accumulate long.

SABALB: Signed absolute difference and accumulate long (bottom).

SABALT: Signed absolute difference and accumulate long (top).

SABD: Signed absolute difference (predicated).

SABDLB: Signed absolute difference long (bottom).

SABDLT: Signed absolute difference long (top).

SADALP: Signed add and accumulate long pairwise.

SADDLB: Signed add long (bottom).

SADDLBT: Signed add long (bottom + top).

SADDLT: Signed add long (top).

SADDV: Signed add reduction to scalar.

SADDWB: Signed add wide (bottom).

SADDWT: Signed add wide (top).

SBCLB: Subtract with carry long (bottom).

SBCLT: Subtract with carry long (top).

SCLAMP: Signed clamp to minimum/maximum.

SCVTF (bottom, unpredicated): Signed integer convert to floating-point (bottom, unpredicated).

SCVTF (predicated): Signed integer convert to floating-point (predicated).

SCVTFLT: Signed integer convert to floating-point (top, unpredicated).

SDIV: Signed divide (predicated).

SDIVR: Signed reversed divide (predicated).

SDOT (2-way, indexed): Signed integer dot product by indexed element (two-way).

SDOT (2-way, vectors): Signed integer dot product (two-way).

SDOT (4-way, indexed): Signed integer dot product by indexed element (four-way).

SDOT (4-way, vectors): Signed integer dot product (four-way).

SEL (predicates): Conditionally select elements from two predicates.

SEL (vectors): Conditionally select elements from two vectors.

SETFFR: Initialize the first-fault register to all true.

SHADD: Signed halving add.

SHRNB: Shift right narrow by immediate (bottom).

SHRNT: Shift right narrow by immediate (top).

SHSUB: Signed halving subtract.

SHSUBR: Signed halving subtract reversed.

SLI: Shift left and insert (immediate).

SM4E: SM4 encryption and decryption.

SM4EKEY: SM4 key updates.

SMAX (immediate): Signed maximum with immediate (unpredicated).

SMAX (vectors): Signed maximum (predicated).

SMAXP: Signed maximum pairwise.

SMAXQV: Signed maximum reduction of quadword vector segments.

SMAXV: Signed maximum reduction to scalar.

SMIN (immediate): Signed minimum with immediate (unpredicated).

SMIN (vectors): Signed minimum (predicated).

SMINP: Signed minimum pairwise.

SMINQV: Signed minimum reduction of quadword vector segments.

SMINV: Signed minimum reduction to scalar.

SMLALB (indexed): Signed multiply-add long by indexed element (bottom).

SMLALB (vectors): Signed multiply-add long (bottom).

SMLALT (indexed): Signed multiply-add long by indexed element (top).

SMLALT (vectors): Signed multiply-add long (top).

SMLSLB (indexed): Signed multiply-subtract long by indexed element (bottom).

SMLSLB (vectors): Signed multiply-subtract long (bottom).

SMLSLT (indexed): Signed multiply-subtract long by indexed element (top).

SMLSLT (vectors): Signed multiply-subtract long (top).

SMMLA: Signed 8-bit integer matrix multiply-accumulate to 32-bit integer.

SMULH (predicated): Signed multiply returning high half (predicated).

SMULH (unpredicated): Signed multiply returning high half (unpredicated).

SMULLB (indexed): Signed multiply long by indexed element (bottom).

SMULLB (vectors): Signed multiply long (bottom).

SMULLT (indexed): Signed multiply long by indexed element (top).

SMULLT (vectors): Signed multiply long (top).

SPLICE: Splice two vectors under predicate control.

SQABS: Signed saturating absolute value.

SQADD (immediate): Signed saturating add immediate (unpredicated).

SQADD (vectors, predicated): Signed saturating add (predicated).

SQADD (vectors, unpredicated): Signed saturating add (unpredicated).

SQCADD: Saturating complex integer add.

SQCVTN: Signed 32-bit integer saturating extract narrow to interleaved 16-bit integer.

SQCVTUN: Signed 32-bit integer saturating extract narrow to interleaved unsigned 16-bit integer.

SQDECB: Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

SQDECD (scalar): Signed saturating decrement scalar by multiple of 64-bit predicate constraint element count.

SQDECD (vector): Signed saturating decrement vector by multiple of 64-bit predicate constraint element count.

SQDECH (scalar): Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count.

SQDECH (vector): Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

SQDECP (scalar): Signed saturating decrement scalar by count of true predicate elements.

SQDECP (vector): Signed saturating decrement vector by count of true predicate elements.

SQDECW (scalar): Signed saturating decrement scalar by multiple of 32-bit predicate constraint element count.

SQDECW (vector): Signed saturating decrement vector by multiple of 32-bit predicate constraint element count.

SQDMLALB (indexed): Signed saturating doubling multiply-add by indexed element (bottom).

SQDMLALB (vectors): Signed saturating doubling multiply-add (bottom).

SQDMLALBT: Signed saturating doubling multiply-add (bottom × top).

SQDMLALT (indexed): Signed saturating doubling multiply-add by indexed element (top).

SQDMLALT (vectors): Signed saturating doubling multiply-add (top).

SQDMLSLB (indexed): Signed saturating doubling multiply-subtract by indexed element (bottom).

SQDMLSLB (vectors): Signed saturating doubling multiply-subtract (bottom).

SQDMLSLBT: Signed saturating doubling multiply-subtract (bottom × top).

SQDMLSLT (indexed): Signed saturating doubling multiply-subtract by indexed element (top).

SQDMLSLT (vectors): Signed saturating doubling multiply-subtract (top).

SQDMULH (indexed): Signed saturating doubling multiply high by indexed element.

SQDMULH (vectors): Signed saturating doubling multiply high (unpredicated).

SQDMULLB (indexed): Signed saturating doubling multiply by indexed element (bottom).

SQDMULLB (vectors): Signed saturating doubling multiply (bottom).

SQDMULLT (indexed): Signed saturating doubling multiply by indexed element (top).

SQDMULLT (vectors): Signed saturating doubling multiply (top).

SQINCB: Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

SQINCD (scalar): Signed saturating increment scalar by multiple of 64-bit predicate constraint element count.

SQINCD (vector): Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

SQINCH (scalar): Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

SQINCH (vector): Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

SQINCP (scalar): Signed saturating increment scalar by count of true predicate elements.

SQINCP (vector): Signed saturating increment vector by count of true predicate elements.

SQINCW (scalar): Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

SQINCW (vector): Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

SQNEG: Signed saturating negate.

SQRDCMLAH (indexed): Saturating rounding doubling complex integer multiply-add high by indexed element.

SQRDCMLAH (vectors): Saturating rounding doubling complex integer multiply-add high.

SQRDMLAH (indexed): Signed saturating rounding doubling multiply-add high by indexed element.

SQRDMLAH (vectors): Signed saturating rounding doubling multiply-add high (unpredicated).

SQRDMLSH (indexed): Signed saturating rounding doubling multiply-subtract high by indexed element.

SQRDMLSH (vectors): Signed saturating rounding doubling multiply-subtract high (unpredicated).

SQRDMULH (indexed): Signed saturating rounding doubling multiply high by indexed element.

SQRDMULH (vectors): Signed saturating rounding doubling multiply high (unpredicated).

SQRSHL: Signed saturating rounding shift left (predicated).

SQRSHLR: Signed saturating rounding shift left reversed (predicated).

SQRSHRN: Signed saturating rounding shift right narrow by immediate to interleaved integer.

SQRSHRNB: Signed saturating rounding shift right narrow by immediate (bottom).

SQRSHRNT: Signed saturating rounding shift right narrow by immediate (top).

SQRSHRUN: Signed saturating rounding shift right unsigned narrow by immediate and interleave.

SQRSHRUNB: Signed saturating rounding shift right narrow by immediate to unsigned integer (bottom).

SQRSHRUNT: Signed saturating rounding shift right narrow by immediate to unsigned integer (top).

SQSHL (immediate): Signed saturating shift left by immediate.

SQSHL (vectors): Signed saturating shift left (predicated).

SQSHLR: Signed saturating shift left reversed (predicated).

SQSHLU: Signed saturating shift left unsigned by immediate.

SQSHRN: Signed saturating shift right narrow by immediate to interleaved integer.

SQSHRNB: Signed saturating shift right narrow by immediate (bottom).

SQSHRNT: Signed saturating shift right narrow by immediate (top).

SQSHRUN: Signed saturating shift right narrow by immediate to interleaved unsigned integer.

SQSHRUNB: Signed saturating shift right narrow by immediate to unsigned integer (bottom).

SQSHRUNT: Signed saturating shift right narrow by immediate to unsigned integer (top).

SQSUB (immediate): Signed saturating subtract immediate (unpredicated).

SQSUB (vectors, predicated): Signed saturating subtract (predicated).

SQSUB (vectors, unpredicated): Signed saturating subtract (unpredicated).

SQSUBR: Signed saturating subtract reversed (predicated).

SQXTNB: Signed saturating extract narrow (bottom).

SQXTNT: Signed saturating extract narrow (top).

SQXTUNB: Signed saturating extract narrow to unsigned integer (bottom).

SQXTUNT: Signed saturating extract narrow to unsigned integer (top).

SRHADD: Signed rounding halving add.

SRI: Shift right and insert (immediate).

SRSHL: Signed rounding shift left (predicated).

SRSHLR: Signed rounding shift left reversed (predicated).

SRSHR: Signed rounding shift right by immediate.

SRSRA: Signed rounding shift right and accumulate (immediate).

SSHLLB: Signed shift left long by immediate (bottom).

SSHLLT: Signed shift left long by immediate (top).

SSRA: Signed shift right and accumulate (immediate).

SSUBLB: Signed subtract long (bottom).

SSUBLBT: Signed subtract long (bottom - top).

SSUBLT: Signed subtract long (top).

SSUBLTB: Signed subtract long (top - bottom).

SSUBWB: Signed subtract wide (bottom).

SSUBWT: Signed subtract wide (top).

ST1B (scalar plus immediate, consecutive registers): Contiguous store of bytes from multiple consecutive vectors (immediate index).

ST1B (scalar plus immediate, single register): Contiguous store bytes from vector (immediate index).

ST1B (scalar plus scalar, consecutive registers): Contiguous store of bytes from multiple consecutive vectors (scalar index).

ST1B (scalar plus scalar, single register): Contiguous store bytes from vector (scalar index).

ST1B (scalar plus vector): Scatter store bytes from a vector (vector index).

ST1B (vector plus immediate): Scatter store bytes from a vector (immediate index).

ST1D (scalar plus immediate, consecutive registers): Contiguous store of doublewords from multiple consecutive vectors (immediate index).

ST1D (scalar plus immediate, single register): Contiguous store doublewords from vector (immediate index).

ST1D (scalar plus scalar, consecutive registers): Contiguous store of doublewords from multiple consecutive vectors (scalar index).

ST1D (scalar plus scalar, single register): Contiguous store doublewords from vector (scalar index).

ST1D (scalar plus vector): Scatter store doublewords from a vector (vector index).

ST1D (vector plus immediate): Scatter store doublewords from a vector (immediate index).

ST1H (scalar plus immediate, consecutive registers): Contiguous store of halfwords from multiple consecutive vectors (immediate index).

ST1H (scalar plus immediate, single register): Contiguous store halfwords from vector (immediate index).

ST1H (scalar plus scalar, consecutive registers): Contiguous store of halfwords from multiple consecutive vectors (scalar index).

ST1H (scalar plus scalar, single register): Contiguous store halfwords from vector (scalar index).

ST1H (scalar plus vector): Scatter store halfwords from a vector (vector index).

ST1H (vector plus immediate): Scatter store halfwords from a vector (immediate index).

ST1Q: Scatter store quadwords.

ST1W (scalar plus immediate, consecutive registers): Contiguous store of words from multiple consecutive vectors (immediate index).

ST1W (scalar plus immediate, single register): Contiguous store words from vector (immediate index).

ST1W (scalar plus scalar, consecutive registers): Contiguous store of words from multiple consecutive vectors (scalar index).

ST1W (scalar plus scalar, single register): Contiguous store words from vector (scalar index).

ST1W (scalar plus vector): Scatter store words from a vector (vector index).

ST1W (vector plus immediate): Scatter store words from a vector (immediate index).

ST2B (scalar plus immediate): Contiguous store two-byte structures from two vectors (immediate index).

ST2B (scalar plus scalar): Contiguous store two-byte structures from two vectors (scalar index).

ST2D (scalar plus immediate): Contiguous store two-doubleword structures from two vectors (immediate index).

ST2D (scalar plus scalar): Contiguous store two-doubleword structures from two vectors (scalar index).

ST2H (scalar plus immediate): Contiguous store two-halfword structures from two vectors (immediate index).

ST2H (scalar plus scalar): Contiguous store two-halfword structures from two vectors (scalar index).

ST2Q (scalar plus immediate): Contiguous store two-quadword structures from two vectors (immediate index).

ST2Q (scalar plus scalar): Contiguous store two-quadword structures from two vectors (scalar index).

ST2W (scalar plus immediate): Contiguous store two-word structures from two vectors (immediate index).

ST2W (scalar plus scalar): Contiguous store two-word structures from two vectors (scalar index).

ST3B (scalar plus immediate): Contiguous store three-byte structures from three vectors (immediate index).

ST3B (scalar plus scalar): Contiguous store three-byte structures from three vectors (scalar index).

ST3D (scalar plus immediate): Contiguous store three-doubleword structures from three vectors (immediate index).

ST3D (scalar plus scalar): Contiguous store three-doubleword structures from three vectors (scalar index).

ST3H (scalar plus immediate): Contiguous store three-halfword structures from three vectors (immediate index).

ST3H (scalar plus scalar): Contiguous store three-halfword structures from three vectors (scalar index).

ST3Q (scalar plus immediate): Contiguous store three-quadword structures from three vectors (immediate index).

ST3Q (scalar plus scalar): Contiguous store three-quadword structures from three vectors (scalar index).

ST3W (scalar plus immediate): Contiguous store three-word structures from three vectors (immediate index).

ST3W (scalar plus scalar): Contiguous store three-word structures from three vectors (scalar index).

ST4B (scalar plus immediate): Contiguous store four-byte structures from four vectors (immediate index).

ST4B (scalar plus scalar): Contiguous store four-byte structures from four vectors (scalar index).

ST4D (scalar plus immediate): Contiguous store four-doubleword structures from four vectors (immediate index).

ST4D (scalar plus scalar): Contiguous store four-doubleword structures from four vectors (scalar index).

ST4H (scalar plus immediate): Contiguous store four-halfword structures from four vectors (immediate index).

ST4H (scalar plus scalar): Contiguous store four-halfword structures from four vectors (scalar index).

ST4Q (scalar plus immediate): Contiguous store four-quadword structures from four vectors (immediate index).

ST4Q (scalar plus scalar): Contiguous store four-quadword structures from four vectors (scalar index).

ST4W (scalar plus immediate): Contiguous store four-word structures from four vectors (immediate index).

ST4W (scalar plus scalar): Contiguous store four-word structures from four vectors (scalar index).

STLRO: Store-release octaword.

STNT1B (scalar plus immediate, consecutive registers): Contiguous store non-temporal of bytes from multiple consecutive vectors (immediate index).

STNT1B (scalar plus immediate, single register): Contiguous store non-temporal bytes from vector (immediate index).

STNT1B (scalar plus scalar, consecutive registers): Contiguous store non-temporal of bytes from multiple consecutive vectors (scalar index).

STNT1B (scalar plus scalar, single register): Contiguous store non-temporal bytes from vector (scalar index).

STNT1B (vector plus scalar): Scatter store non-temporal bytes.

STNT1D (scalar plus immediate, consecutive registers): Contiguous store non-temporal of doublewords from multiple consecutive vectors (immediate index).

STNT1D (scalar plus immediate, single register): Contiguous store non-temporal doublewords from vector (immediate index).

STNT1D (scalar plus scalar, consecutive registers): Contiguous store non-temporal of doublewords from multiple consecutive vectors (scalar index).

STNT1D (scalar plus scalar, single register): Contiguous store non-temporal doublewords from vector (scalar index).

STNT1D (vector plus scalar): Scatter store non-temporal doublewords.

STNT1H (scalar plus immediate, consecutive registers): Contiguous store non-temporal of halfwords from multiple consecutive vectors (immediate index).

STNT1H (scalar plus immediate, single register): Contiguous store non-temporal halfwords from vector (immediate index).

STNT1H (scalar plus scalar, consecutive registers): Contiguous store non-temporal of halfwords from multiple consecutive vectors (scalar index).

STNT1H (scalar plus scalar, single register): Contiguous store non-temporal halfwords from vector (scalar index).

STNT1H (vector plus scalar): Scatter store non-temporal halfwords.

STNT1W (scalar plus immediate, consecutive registers): Contiguous store non-temporal of words from multiple consecutive vectors (immediate index).

STNT1W (scalar plus immediate, single register): Contiguous store non-temporal words from vector (immediate index).

STNT1W (scalar plus scalar, consecutive registers): Contiguous store non-temporal of words from multiple consecutive vectors (scalar index).

STNT1W (scalar plus scalar, single register): Contiguous store non-temporal words from vector (scalar index).

STNT1W (vector plus scalar): Scatter store non-temporal words.

STR (predicate): Store predicate register.

STR (vector): Store vector register.

SUB (immediate): Subtract immediate (unpredicated).

SUB (vectors, predicated): Subtract (predicated).

SUB (vectors, unpredicated): Subtract (unpredicated).

SUBHNB: Subtract narrow high part (bottom).

SUBHNT: Subtract narrow high part (top).

SUBP: Subtract pairwise.

SUBPT (predicated): Subtract checked pointer vectors (predicated).

SUBPT (unpredicated): Subtract checked pointer vectors (unpredicated).

SUBR (immediate): Reversed subtract from immediate (unpredicated).

SUBR (vectors): Reversed subtract (predicated).

SUDOT: Signed by unsigned 8-bit integer dot product by indexed element to 32-bit integer.

SUNPKHI, SUNPKLO: Signed unpack and extend half of vector.

SUQADD: Signed saturating unsigned add.

SXTB, SXTH, SXTW: Signed byte / halfword / word extend (predicated).

TBL: Programmable table lookup in one or two vector table (zeroing).

TBLQ: Programmable table lookup within each quadword vector segment (zeroing).

TBX: Programmable table lookup in single vector table (merging).

TBXQ: Programmable table lookup within each quadword vector segment (merging).

TRN1, TRN2 (predicates): Interleave even or odd elements from two predicates.

TRN1, TRN2 (vectors): Interleave even or odd elements from two vectors.

UABA: Unsigned absolute difference and accumulate.

UABAL: Two-way unsigned absolute difference sum and accumulate long.

UABALB: Unsigned absolute difference and accumulate long (bottom).

UABALT: Unsigned absolute difference and accumulate long (top).

UABD: Unsigned absolute difference (predicated).

UABDLB: Unsigned absolute difference long (bottom).

UABDLT: Unsigned absolute difference long (top).

UADALP: Unsigned add and accumulate long pairwise.

UADDLB: Unsigned add long (bottom).

UADDLT: Unsigned add long (top).

UADDV: Unsigned add reduction to scalar.

UADDWB: Unsigned add wide (bottom).

UADDWT: Unsigned add wide (top).

UCLAMP: Unsigned clamp to minimum/maximum.

UCVTF (bottom, unpredicated): Unsigned integer convert to floating-point (bottom, unpredicated).

UCVTF (predicated): Unsigned integer convert to floating-point (predicated).

UCVTFLT: Unsigned integer convert to floating-point (top, unpredicated).

UDIV: Unsigned divide (predicated).

UDIVR: Unsigned reversed divide (predicated).

UDOT (2-way, indexed): Unsigned integer dot product by indexed element (two-way).

UDOT (2-way, vectors): Unsigned integer dot product (two-way).

UDOT (4-way, indexed): Unsigned integer dot product by indexed element (four-way).

UDOT (4-way, vectors): Unsigned integer dot product (four-way).

UHADD: Unsigned halving add.

UHSUB: Unsigned halving subtract.

UHSUBR: Unsigned halving subtract reversed.

UMAX (immediate): Unsigned maximum with immediate (unpredicated).

UMAX (vectors): Unsigned maximum (predicated).

UMAXP: Unsigned maximum pairwise.

UMAXQV: Unsigned maximum reduction of quadword vector segments.

UMAXV: Unsigned maximum reduction to scalar.

UMIN (immediate): Unsigned minimum with immediate (unpredicated).

UMIN (vectors): Unsigned minimum (predicated).

UMINP: Unsigned minimum pairwise.

UMINQV: Unsigned minimum reduction of quadword vector segments.

UMINV: Unsigned minimum reduction to scalar.

UMLALB (indexed): Unsigned multiply-add long by indexed element (bottom).

UMLALB (vectors): Unsigned multiply-add long (bottom).

UMLALT (indexed): Unsigned multiply-add long by indexed element (top).

UMLALT (vectors): Unsigned multiply-add long (top).

UMLSLB (indexed): Unsigned multiply-subtract long by indexed element (bottom).

UMLSLB (vectors): Unsigned multiply-subtract long (bottom).

UMLSLT (indexed): Unsigned multiply-subtract long by indexed element (top).

UMLSLT (vectors): Unsigned multiply-subtract long (top).

UMMLA: Unsigned 8-bit integer matrix multiply-accumulate to 32-bit integer.

UMULH (predicated): Unsigned multiply returning high half (predicated).

UMULH (unpredicated): Unsigned multiply returning high half (unpredicated).

UMULLB (indexed): Unsigned multiply long by indexed element (bottom).

UMULLB (vectors): Unsigned multiply long (bottom).

UMULLT (indexed): Unsigned multiply long by indexed element (top).

UMULLT (vectors): Unsigned multiply long (top).

UQADD (immediate): Unsigned saturating add immediate (unpredicated).

UQADD (vectors, predicated): Unsigned saturating add (predicated).

UQADD (vectors, unpredicated): Unsigned saturating add (unpredicated).

UQCVTN: Unsigned 32-bit integer saturating extract narrow to interleaved 16-bit integer.

UQDECB: Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.

UQDECD (scalar): Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.

UQDECD (vector): Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count.

UQDECH (scalar): Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count.

UQDECH (vector): Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.

UQDECP (scalar): Unsigned saturating decrement scalar by count of true predicate elements.

UQDECP (vector): Unsigned saturating decrement vector by count of true predicate elements.

UQDECW (scalar): Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.

UQDECW (vector): Unsigned saturating decrement vector by multiple of 32-bit predicate constraint element count.

UQINCB: Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count.

UQINCD (scalar): Unsigned saturating increment scalar by multiple of 64-bit predicate constraint element count.

UQINCD (vector): Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.

UQINCH (scalar): Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.

UQINCH (vector): Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count.

UQINCP (scalar): Unsigned saturating increment scalar by count of true predicate elements.

UQINCP (vector): Unsigned saturating increment vector by count of true predicate elements.

UQINCW (scalar): Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.

UQINCW (vector): Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.

UQRSHL: Unsigned saturating rounding shift left (predicated).

UQRSHLR: Unsigned saturating rounding shift left reversed (predicated).

UQRSHRN: Unsigned saturating rounding shift right narrow by immediate to interleaved integer.

UQRSHRNB: Unsigned saturating rounding shift right narrow by immediate (bottom).

UQRSHRNT: Unsigned saturating rounding shift right narrow by immediate (top).

UQSHL (immediate): Unsigned saturating shift left by immediate.

UQSHL (vectors): Unsigned saturating shift left (predicated).

UQSHLR: Unsigned saturating shift left reversed (predicated).

UQSHRN: Unsigned saturating shift right narrow by immediate to interleaved integer.

UQSHRNB: Unsigned saturating shift right narrow by immediate (bottom).

UQSHRNT: Unsigned saturating shift right narrow by immediate (top).

UQSUB (immediate): Unsigned saturating subtract immediate (unpredicated).

UQSUB (vectors, predicated): Unsigned saturating subtract (predicated).

UQSUB (vectors, unpredicated): Unsigned saturating subtract (unpredicated).

UQSUBR: Unsigned saturating subtract reversed (predicated).

UQXTNB: Unsigned saturating extract narrow (bottom).

UQXTNT: Unsigned saturating extract narrow (top).

URECPE: Unsigned reciprocal estimate (predicated).

URHADD: Unsigned rounding halving add.

URSHL: Unsigned rounding shift left (predicated).

URSHLR: Unsigned rounding shift left reversed (predicated).

URSHR: Unsigned rounding shift right by immediate.

URSQRTE: Unsigned reciprocal square root estimate (predicated).

URSRA: Unsigned rounding shift right and accumulate (immediate).

USDOT (indexed): Unsigned by signed 8-bit integer dot product by indexed element to 32-bit integer.

USDOT (vectors): Unsigned by signed 8-bit integer dot product to 32-bit integer.

USHLLB: Unsigned shift left long by immediate (bottom).

USHLLT: Unsigned shift left long by immediate (top).

USMMLA: Unsigned by signed 8-bit integer matrix multiply-accumulate to 32-bit integer.

USQADD: Unsigned saturating signed add.

USRA: Unsigned shift right and accumulate (immediate).

USUBLB: Unsigned subtract long (bottom).

USUBLT: Unsigned subtract long (top).

USUBWB: Unsigned subtract wide (bottom).

USUBWT: Unsigned subtract wide (top).

UUNPKHI, UUNPKLO: Unsigned unpack and extend half of vector.

UXTB, UXTH, UXTW: Unsigned byte / halfword / word extend (predicated).

UZP1, UZP2 (predicates): Concatenate even or odd elements from two predicates.

UZP1, UZP2 (vectors): Concatenate even or odd elements from two vectors.

UZPQ1: Concatenate even elements within each pair of quadword vector segments.

UZPQ2: Concatenate odd elements within each pair of quadword vector segments.

WHILEGE (predicate as counter): While decrementing signed scalar greater than or equal to scalar (predicate-as-counter).

WHILEGE (predicate pair): While decrementing signed scalar greater than or equal to scalar (pair of predicates).

WHILEGE (predicate): While decrementing signed scalar greater than or equal to scalar.

WHILEGT (predicate as counter): While decrementing signed scalar greater than scalar (predicate-as-counter).

WHILEGT (predicate pair): While decrementing signed scalar greater than scalar (pair of predicates).

WHILEGT (predicate): While decrementing signed scalar greater than scalar.

WHILEHI (predicate as counter): While decrementing unsigned scalar higher than scalar (predicate-as-counter).

WHILEHI (predicate pair): While decrementing unsigned scalar higher than scalar (pair of predicates).

WHILEHI (predicate): While decrementing unsigned scalar higher than scalar.

WHILEHS (predicate as counter): While decrementing unsigned scalar higher than or same as scalar (predicate-as-counter).

WHILEHS (predicate pair): While decrementing unsigned scalar higher than or same as scalar (pair of predicates).

WHILEHS (predicate): While decrementing unsigned scalar higher than or same as scalar.

WHILELE (predicate as counter): While incrementing signed scalar less than or equal to scalar (predicate-as-counter).

WHILELE (predicate pair): While incrementing signed scalar less than or equal to scalar (pair of predicates).

WHILELE (predicate): While incrementing signed scalar less than or equal to scalar.

WHILELO (predicate as counter): While incrementing unsigned scalar lower than scalar (predicate-as-counter).

WHILELO (predicate pair): While incrementing unsigned scalar lower than scalar (pair of predicates).

WHILELO (predicate): While incrementing unsigned scalar lower than scalar.

WHILELS (predicate as counter): While incrementing unsigned scalar lower than or same as scalar (predicate-as-counter).

WHILELS (predicate pair): While incrementing unsigned scalar lower than or same as scalar (pair of predicates).

WHILELS (predicate): While incrementing unsigned scalar lower than or same as scalar.

WHILELT (predicate as counter): While incrementing signed scalar less than scalar (predicate-as-counter).

WHILELT (predicate pair): While incrementing signed scalar less than scalar (pair of predicates).

WHILELT (predicate): While incrementing signed scalar less than scalar.

WHILERW: While free of read-after-write conflicts.

WHILEWR: While free of write-after-read/write conflicts.

WRFFR: Write the first-fault register.

XAR: Bitwise exclusive-OR and rotate right by immediate.

ZIP1, ZIP2 (predicates): Interleave elements from two half predicates.

ZIP1, ZIP2 (vectors): Interleave elements from two half vectors.

ZIPQ1: Interleave elements from low halves of each pair of quadword vector segments.

ZIPQ2: Interleave elements from high halves of each pair of quadword vector segments.

ABS

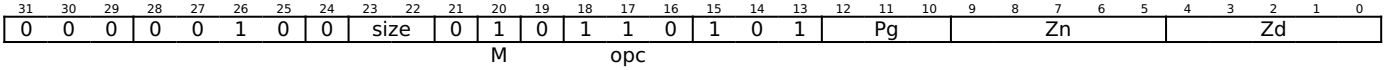
Absolute value (predicated)

This instruction calculates the absolute value of the signed integer in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. If the value in an element of the source vector is the most negative value, the result for that element is the same as the value in that element of the source vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

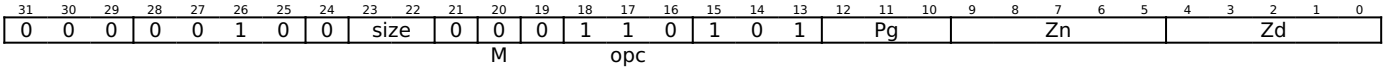
```
ABS <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
ABS <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        var element : integer = SInt(operand[e*:esize]);
        element = Abs(element);
        result[e*:esize] = element[esize-1:0];

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

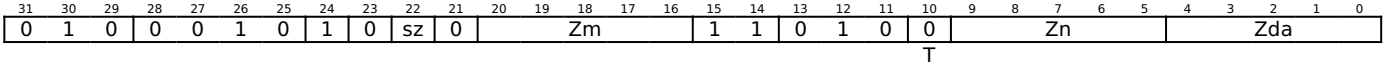
ADCLB

Add with carry long (bottom)

This instruction adds the even-numbered elements of the first source vector and the 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector to the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
ADCLB <Zda>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV (esize * 2);
let operand : bits(VL) = Z{}(n);
let carries : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for p = 0 to pairs-1 do
    let element1 : bits(esize) = result[(2*p + 0)*:esize];
    let element2 : bits(esize) = operand[(2*p + 0)*:esize];
    let carry_in : bit = carries[(2*p + 1)*:esize][0];

    let (res, nzcv) = AddWithCarry{esize}(element1, element2, carry_in);
    let carry_out : bit = nzcv[1];

    result[(2*p + 0)*:esize] = res;
    result[(2*p + 1)*:esize] = ZeroExtend{esize}(carry_out);
end;

Z{VL}(da) = result;
```

Operational information

ADD (immediate)

Add immediate (unpredicated)

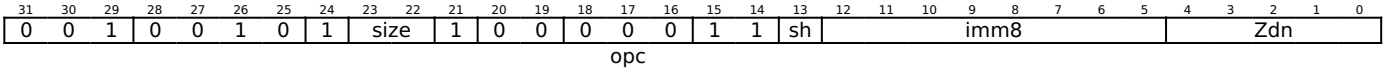
This instruction adds an unsigned immediate to each element of the source vector, and destructively places the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    result[e*:esize] = element1 + imm;

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

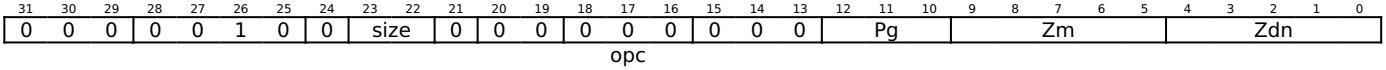
ADD (vectors, predicated)

Add (predicated)

This instruction adds Active elements of the first source vector to the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 + element2;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

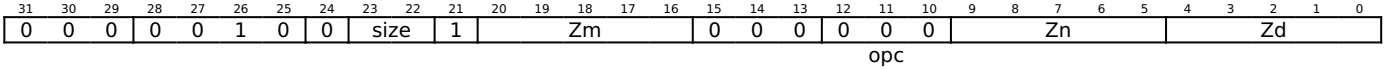
ADD (vectors, unpredicated)

Add (unpredicated)

This instruction adds all elements of the first source vector to the corresponding elements of the second source vector, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ADD <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = element1 + element2;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

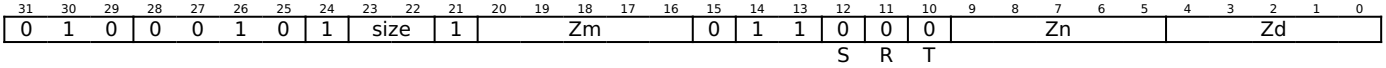
ADDHNB

Add narrow high part (bottom)

This instruction adds each vector element of the first source vector to the corresponding vector element of the second source vector, and places the most significant half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
ADDHNB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);
let halfesize : integer{} = esize DIV 2;

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    let res : integer = (element1 + element2) >> halfesize;
    result[(2*e + 0)*:halfesize] = res[halfesize-1:0];
    result[(2*e + 1)*:halfesize] = Zeros{halfesize};

end;
Z{VL}(d) = result;
```

Operational information

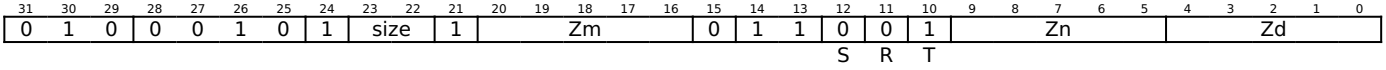
ADDHNT

Add narrow high part (top)

This instruction adds each vector element of the first source vector to the corresponding vector element of the second source vector, and places the most significant half of the result in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
ADDHNT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

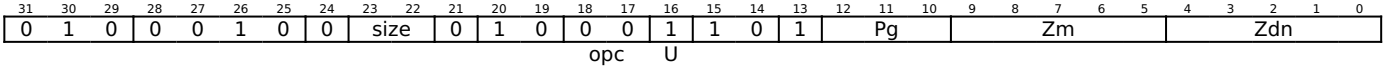
ADDP

Add pairwise

This instruction adds pairs of adjacent elements within each source vector, and destructively places the interleaved results in the first source vector.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
ADDP <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);

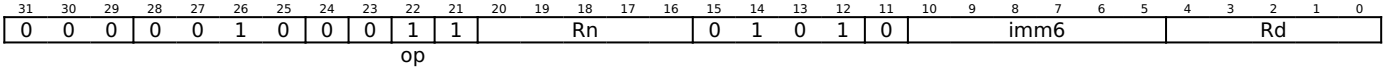
ADDPL

Add multiple of predicate register size to scalar register

This instruction adds the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and places the result in the 64-bit destination general-purpose register or current stack pointer.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ADDPL <Xd|SP>, <Xn|SP>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd|SP>	Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Xn|SP>	Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let operand1 : bits(64) = if n == 31 then SP{64}() else X{64}(n);
let result : bits(64) = operand1 + (imm * (PL DIV 8));

if d == 31 then
    SP{64}() = result;
else
    X{64}(d) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

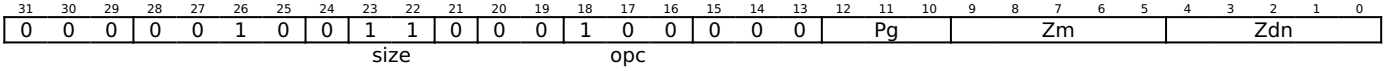
ADDPT (predicated)

Add checked pointer vectors (predicated)

This instruction adds, with pointer check, Active elements of the first source vector to the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE && FEAT_CPA)



Encoding

```
ADDPT <Zdn>.D, <Pg>/M, <Zdn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_CPA) then
    EndOfDecode(Decode_UNDEF);
end;
let g : integer =  UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer =  UInt(Zm);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV 64;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, 64) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand1[e*:64];
    let element2 : bits(64) = operand2[e*:64];
    if ActivePredicateElement{PL}(mask, e, 64) then
        let res : bits(64) = element1 + element2;
        result[e*:64] = PointerAddCheck(res, element1);
    else
        result[e*:64] = operand1[e*:64];
    end;

    Z{VL}(dn) = result;
end;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

ADDQP

Add pairwise within quadword vector segments (unpredicated)

This instruction adds pairs of adjacent elements within each concatenated pair of 128-bit segments of the first and second source vectors, and places the results in the corresponding 128-bit segment of the destination vector.

This instruction is unpredicated.

SVE2

(FEAT_SVE2p3 || FEAT_SME2p3)

Encoding

```
ADDQP <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let elempersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for s = 0 to segments-1 do
    let seg1 : bits(128) = operand1[s*:128];
    let seg2 : bits(128) = operand2[s*:128];
    let concat : bits(256) = seg2::seg1;

    for e = 0 to elempersegment-1 do
        let element1 : bits(esize) = concat[(2*e + 0)*:esize];
        let element2 : bits(esize) = concat[(2*e + 1)*:esize];
        result[(s*elempersegment + e)*:esize] = element1 + element2;
    end;
end;

Z{VL}(d) = result;
```

Operational information

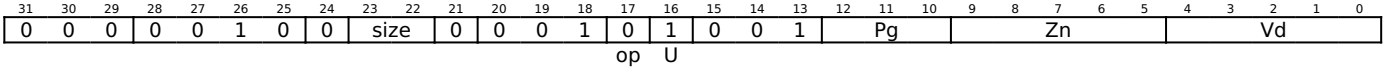
ADDQV

Add reduction of quadword vector segments

This instruction adds the elements of the same position from each 128-bit source vector segment, and places each result into the corresponding element of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as zero.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
ADDQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<Vd> Is the name of the destination SIMD&FP register, encoded in the "Vd" field.

<T> Is an arrangement specifier, encoded in “size”:

size	<T>
00	16B
01	8H
10	4S
11	2D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let segments : integer = VL DIV 128;
let elempersegment : integer = 128 DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(128) = Zeros{};
var stmp : bits(128) = Zeros{};

var dtmp : integer;

for e = 0 to elempersegment-1 do
    dtmp = 0;
    for s = 0 to segments-1 do
        if ActivePredicateElement{PL}(mask, s * elempersegment + e, esize) then
            stmp = operand[s*:128];
            dtmp = dtmp + UInt(stmp[e*:esize]);
        end;
    end;
    result[e*:esize] = dtmp[esize-1:0];
end;

V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV (esize * 2);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to pairs-1 do
    let elt1_a : integer = UInt(operand1[(2*e + 0)*:esize]);
    let elt1_b : integer = UInt(operand1[(2*e + 1)*:esize]);
    let elt2_a : integer = UInt(operand2[(2*e + 0)*:esize]);
    let elt2_b : integer = UInt(operand2[(2*e + 1)*:esize]);
    let res1 : integer = elt1_a + elt1_b;
    let res2 : integer = elt2_a - elt2_b;
    result[(2*e + 0)*:esize] = res1[esize-1:0];
    result[(2*e + 1)*:esize] = res2[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

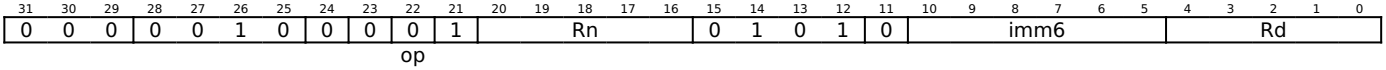
ADDVL

Add multiple of vector register size to scalar register

This instruction adds the current vector register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer, and places the result in the 64-bit destination general-purpose register or current stack pointer.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ADDVL <Xd|SP>, <Xn|SP>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd|SP>	Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Xn|SP>	Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(64) = if n == 31 then SP{64}() else X{64}(n);
let result : bits(64) = operand1 + (imm * (VL DIV 8));

if d == 31 then
    SP{64}() = result;
else
    X{64}(d) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADR

Calculate vector address

This instruction optionally sign-extends or zero-extends the least significant 32 bits of each element from a vector of offsets or indices in the second source vector, and scales each index by 2, 4, or 8. The scaled indices are then added to a vector of base addresses from the first source vector, and the resulting addresses are placed in the destination vector. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: Packed offsets , Unpacked 32-bit signed offsets and Unpacked 32-bit unsigned offsets

Packed offsets

(FEAT_SVE)

Encoding

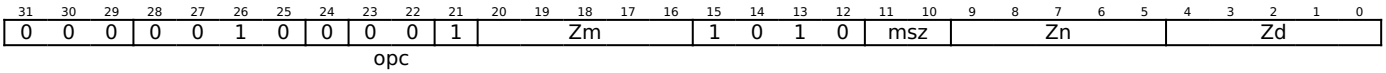
```
ADR <Zd>.<T>, [<Zn>.<T>, <Zm>.<T>{, <mod> <amount>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32 << UInt(sz);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let osize : integer{} = esize;
let unsigned : boolean = TRUE;
let mbytes : integer{} = 1 << UInt(msz);
```

Unpacked 32-bit signed offsets

(FEAT_SVE)



Encoding

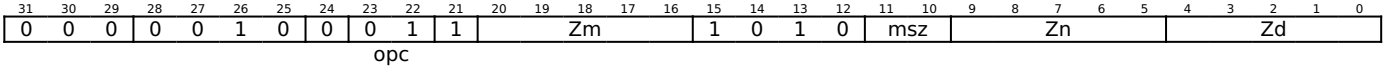
```
ADR <Zd>.D, [<Zn>.D, <Zm>.D, SXTW{<amount>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let osize : integer{} = 32;
let unsigned : boolean = FALSE;
let mbytes : integer{} = 1 << UInt(msz);
```

Unpacked 32-bit unsigned offsets

(FEAT_SVE)



Encoding

```
ADR <Zd>.D, [<Zn>.D, <Zm>.D, UXTW{<amount>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let osize : integer{} = 32;
let unsigned : boolean = TRUE;
let mbytes : integer{} = 1 << UInt(msz);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the offset scalable vector register, encoded in the "Zm" field.

<mod> Is the index extend and shift specifier, encoded in “msz”:

msz	<mod>
00	[absent]
x1	LSL
10	LSL

<amount> Is the index shift amount, encoded in “msz”:

msz	<amount>
00	[absent]
01	#1
10	#2
11	#3

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let base : bits(VL) = Z{}(n);
let offs : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let addr : bits(esize) = base[e*:esize];
    let offselt : bits(osize) = offs[e*:esize][osize-1:0];
    let offset : integer = if unsigned then UInt(offselt) else SInt(offselt);
    result[e*:esize] = addr + (offset * mbytes);
end;

Z{VL}(d) = result;
```

AESD (indexed)

Multi-vector AES single round decryption

This instruction reads a 16-byte state array from each 128-bit segment of the two or four first source vectors, together with a round key from the indexed 128-bit segment of the corresponding 512-bit portion of the second source vector. Each state array undergoes a single round of the AddRoundKey(), InvShiftRows(), and InvSubBytes() transformations in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the two or four first source vectors.

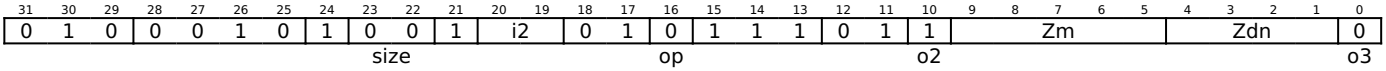
When the vector length is less than 512 bits, the most significant bits of the index are ignored to select the indexed 128-bit segment of the second source vector. This instruction is unpredicated.

This instruction is legal when executed in Streaming SVE mode if both FEAT_SSVE_AES and FEAT_SVE_AES2 are implemented.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SVE_AES2)



Encoding

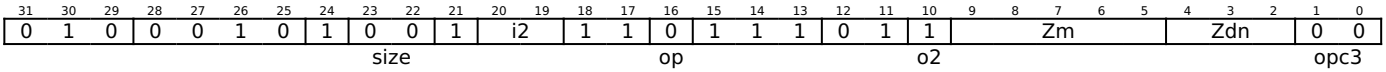
```
AESD { <Zdn1>.B-<Zdn2>.B }, { <Zdn1>.B-<Zdn2>.B }, <Zm>.Q[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES2) then EndOfDecode(Decode_UNDEF); end;
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn::'0');
var index : integer = UInt(i2);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SVE_AES2)



Encoding

```
AESD { <Zdn1>.B-<Zdn4>.B }, { <Zdn1>.B-<Zdn4>.B }, <Zm>.Q[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES2) then EndOfDecode(Decode_UNDEF); end;
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn::'00');
var index : integer = UInt(i2);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.
<Zdn2>	Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<index>	Is the round key index, in the range 0 to 3, encoded in the "i2" field.
<Zdn4>	Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_AES) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
if VL == 128 then index = 0; end;
if VL == 256 then index = index MOD 2; end;
let segments : integer = VL DIV 128;
let operand2 : bits(VL) = Z{}(m);
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{}(dn + r);
    for s = 0 to segments-1 do
        let keyindex : integer = (s - (s MOD 4)) + index;
        let res : bits(128) = operand1[s*:128] XOR operand2[keyindex*:128];
        results[[r]][s*:128] = AESInvSubBytes(AESInvShiftRows(res));

    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn + r) = results[[r]];
end;
```

AESIMC

AES inverse mix columns

This instruction reads a 16-byte state array from each 128-bit segment of the source register, and performs a single round of the InvMixColumns() transformation on each state array in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

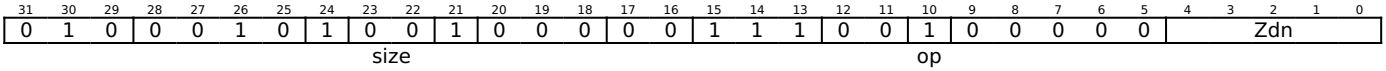
ID_AA64ZFR0_EL1.AES indicates whether this instruction is implemented.

This instruction is legal when executed in Streaming SVE mode if one of the following is true:

- Both FEAT_SSVE_AES and FEAT_SVE_AES are implemented.
- FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE_AES)



Encoding

```
AESIMC <Zdn>.B, <Zdn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES) then EndOfDecode(Decode_UNDEF); end;
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_AES) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let operand : bits(VL) = Z{}(dn);
var result : bits(VL);

for s = 0 to segments-1 do
    result[s*:128] = AESInvMixColumns(operand[s*:128]);
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

AESMC

AES mix columns

This instruction reads a 16-byte state array from each 128-bit segment of the source register, and performs a single round of the MixColumns() transformation on each state array in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

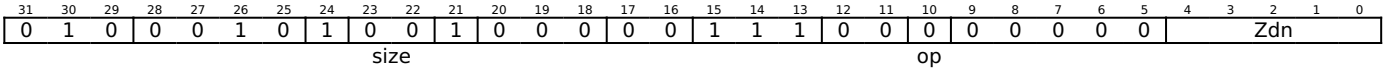
ID_AA64ZFR0_EL1.AES indicates whether this instruction is implemented.

This instruction is legal when executed in Streaming SVE mode if one of the following is true:

- Both FEAT_SSVE_AES and FEAT_SVE_AES are implemented.
- FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE_AES)



Encoding

```
AESMC <Zdn>.B, <Zdn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES) then EndOfDecode(Decode_UNDEF); end;
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_AES) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let operand : bits(VL) = Z{}(dn);
var result : bits(VL);

for s = 0 to segments-1 do
    result[s*:128] = AESMixColumns(operand[s*:128]);
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

AND (immediate)

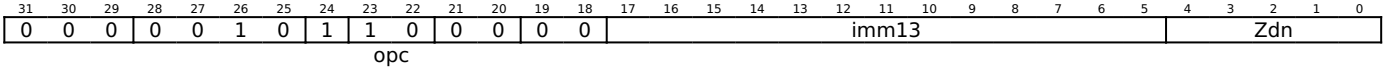
Bitwise AND with immediate (unpredicated)

This instruction performs a bitwise AND between an immediate and each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction BIC (immediate).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
AND <Zdn>.<T>, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn);
var imm : bits(64);
(imm, -) = DecodeBitMasks{64}(imm13[12], imm13[5:0], imm13[11:6], TRUE);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand[e*:64];
    result[e*:64] = element1 AND imm;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

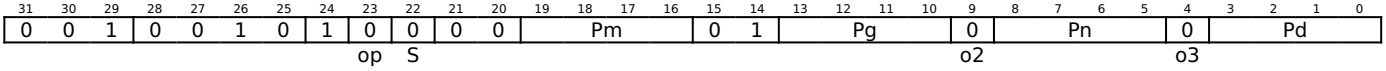
AND (predicates)

Bitwise AND predicates

This instruction performs a bitwise AND between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.
This instruction is used by the alias MOV (predicate, zeroing).

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
AND <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
MOV (predicate, zeroing)	`S == '0' && Pn == Pm`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 AND element2);
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

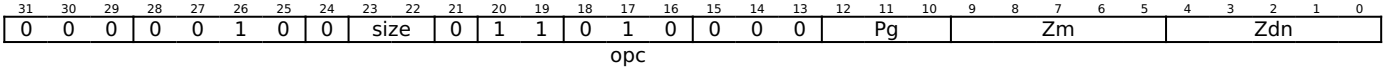
AND (vectors, predicated)

Bitwise AND (predicated)

This instruction performs a bitwise AND between the Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
AND <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 AND element2;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

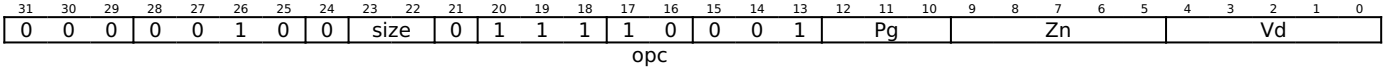
ANDQV

Bitwise AND reduction of quadword vector segments

This instruction performs a bitwise AND between elements in the same position from each 128-bit source vector segment, and places each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as all ones.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
ANDQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<Vd> Is the name of the destination SIMD&FP register, encoded in the "Vd" field.

<T> Is an arrangement specifier, encoded in “size”:

size	<T>
00	16B
01	8H
10	4S
11	2D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let segments : integer = VL DIV 128;
let elempersegment : integer = 128 DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(128) = Zeros{};
var stmp : bits(128) = Zeros{};

var dtmp : bits(esize);

for e = 0 to elempersegment-1 do
    dtmp = Ones{esize};
    for s = 0 to segments-1 do
        if ActivePredicateElement{PL}(mask, s * elempersegment + e, esize) then
            stmp = operand[s*:128];
            dtmp = dtmp AND stmp[e*:esize];
        end;
    end;
    result[e*:esize] = dtmp[esize-1:0];
end;

V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ANDS

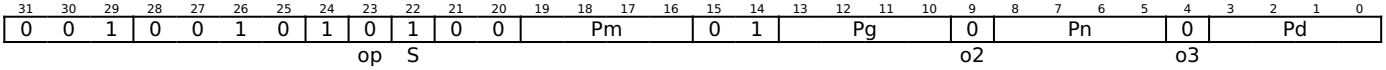
Bitwise AND predicates, setting the condition flags

This instruction performs a bitwise AND between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This instruction is used by the alias MOVS (predicated).

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
ANDS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
MOVS (predicated)	`S == '1' && Pn == Pm`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 AND element2);
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

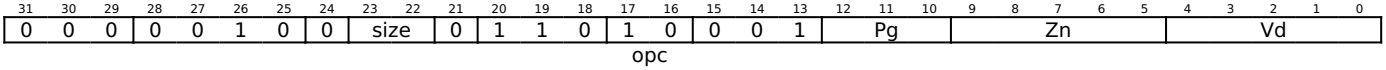
ANDV

Bitwise AND reduction to scalar

This instruction performs a bitwise AND between the elements of the source vector, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as all ones.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ANDV <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(esize) = Ones{esize};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result = result AND operand[e*:esize];

    end;
end;
V{esize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

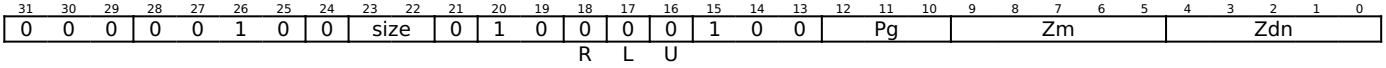
ASR (vectors)

Arithmetic shift right by vector (predicated)

This instruction shifts right, preserving the sign bit, Active elements of the first source vector by the corresponding elements of the second source vector and destructively places the results in the corresponding elements of the first source vector. The shift amount operand is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ASR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        let shift : integer = Min(UInt(element2), esize);
        result[e*:esize] = ASR(element1, shift);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

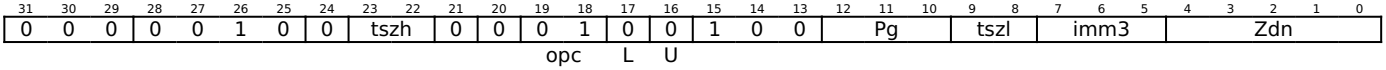
ASRD

Arithmetic shift right for divide by immediate (predicated)

This instruction shifts right by immediate, preserving the sign bit, each Active element of the source vector, and destructively places the results in the corresponding elements of the source vector. The result rounds toward zero as in a signed division. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ASRD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;

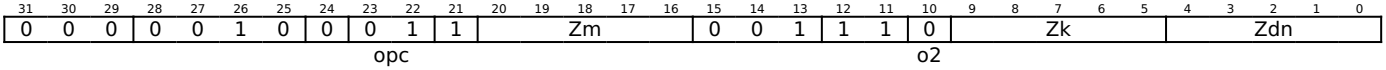
BCAX

Bitwise clear and exclusive-OR

This instruction performs a bitwise AND between elements of the second source vector and the inverted corresponding elements of the third source vector, then an exclusive-OR between the results and the corresponding elements of the first source vector. The final results are destructively placed in the corresponding elements of the destination and first source vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
BCAX <Zdn>.D, <Zdn>.D, <Zm>.D, <Zk>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let m : integer = UInt(Zm);
let k : integer = UInt(Zk);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(k);

Z{VL}(dn) = operand1 XOR (operand2 AND NOT(operand3));
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BDEP

Scatter lower bits into positions selected by bitmask

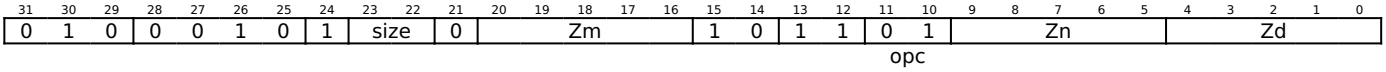
This instruction scatters the lowest-numbered contiguous bits within each element of the first source vector to the bit positions indicated by nonzero bits in the corresponding mask element of the second source vector, preserving their order, and sets the bits corresponding to a zero mask bit to zero. This instruction is unpredicated.

ID_AA64ZFR0_EL1.BitPerm indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled, or FEAT_SSVE_BitPerm is implemented.

SVE2

(FEAT_SVE_BitPerm)



Encoding

```
BDEP <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_BitPerm) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_BitPerm) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();

BFADD (predicated)

BFloat16 add (predicated)

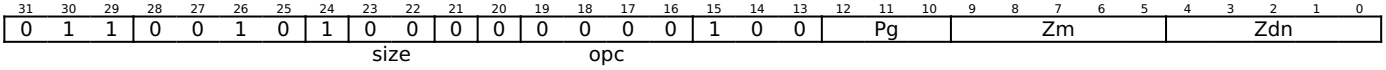
This instruction adds Active BFloat16 elements of the first source vector to the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

SVE2

(FEAT_SVE_B16B16)



Encoding

```
BFADD <Zdn>.H, <Pg>/M, <Zdn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_B16B16) then EndOfDecode(Decode_UNDEF); end;

let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV 16;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, 16) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    if ActivePredicateElement{PL}(mask, e, 16) then
        let element2 : bits(16) = operand2[e*:16];
        result[e*:16] = BFAdd{16}(element1, element2, FPCR());
    else
        result[e*:16] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFADD (unpredicated)

BFloat16 add (unpredicated)

This instruction adds all BFloat16 elements of the first source vector to the corresponding elements of the second source vector and places the results in the corresponding elements of the destination vector.

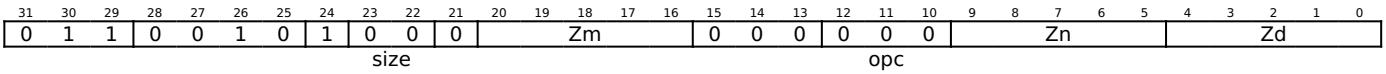
This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

SVE2

(FEAT_SVE_B16B16)



Encoding

```
BFADD <Zd>.H, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_B16B16) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    let element2 : bits(16) = operand2[e*:16];
    result[e*:16] = BFAdd{16}(element1, element2, FPCR());
end;

Z{VL}(d) = result;
```

BFCLAMP

BFloat16 clamp to minimum/maximum number

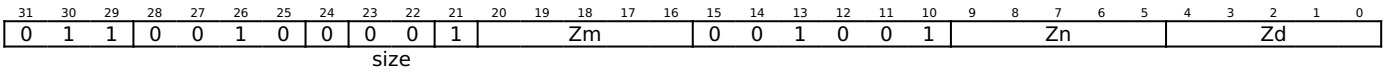
This instruction clamps each BFloat16 element in the destination vector to between the BFloat16 minimum value in the corresponding element of the first source vector and the BFloat16 maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the destination vector.
The behavior is as follows for each minimum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.
This instruction is unpredicated.
ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

SVE2

(FEAT_SVE_B16B16)



Encoding

```
BFCLAMP <Zd>.H, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_B16B16) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var result : bits(VL);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(d);

for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    let element2 : bits(16) = operand2[e*:16];
    let element3 : bits(16) = operand3[e*:16];
    let maxelement : bits(16) = BFMaxNum{}(element1, element3, FPCR());
    result[e*:16] = BFMinNum{16}(maxelement, element2, FPCR());
end;
Z{VL}(d) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFCVT

Single-precision convert to BFloat16 (predicated)

This instruction converts to BFloat16 from single-precision in each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

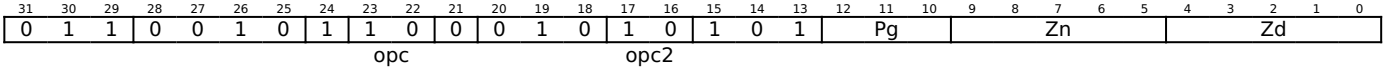
Since the result type is smaller than the input type, the results are zero-extended to fill each destination element.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Merging and Zeroing

Merging

((FEAT_SVE || FEAT_SME) && FEAT_BF16)



Encoding

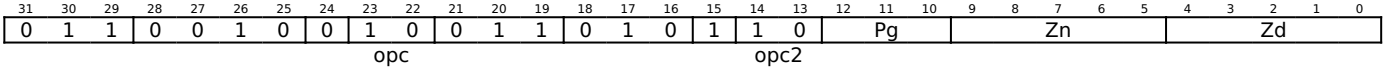
```
BFCVT <Zd>.H, <Pg>/M, <Zn>.S
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_BF16)) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
BFCVT <Zd>.H, <Pg>/Z, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV 32;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, 32) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, 32) then
        let element : bits(32) = operand[e*:32];
        result[(2*e)*:16] = FPConvertBF(element, FPCR());
        result[(2*e+1)*:16] = Zeros{16};

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

BFCVTN

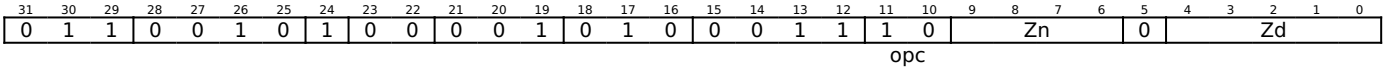
BFloat16 convert to interleaved 8-bit floating-point

This instruction converts each BFloat16 element of the pair of source vectors to 8-bit floating-point while scaling the value by $2^{\text{SInt(FPMR.NSCALE)}}$, and places the two-way interleaved results in the corresponding 8-bit elements of the destination vector. The 8-bit floating-point encoding format is selected by FPMR.F8D.

This instruction is unpredicated.

SVE2

((FEAT_SVE2 || FEAT_SME2) && FEAT_FP8)



Encoding

```
BFCVTN <Zd>.B, { <Zn1>.H-<Zn2>.H }
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
      !IsFeatureImplemented(FEAT_FP8)) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckFPMREnabled();
if IsFeatureImplemented(FEAT_SME2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var result : bits(VL);

let operand1 : bits(VL) = Z{VL}(n+0);
let operand2 : bits(VL) = Z{VL}(n+1);
for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    let element2 : bits(16) = operand2[e*:16];
    result[(2*e + 0)*:8] = BFConvertFP8(element1, FPCR(), FPMR());
    result[(2*e + 1)*:8] = BFConvertFP8(element2, FPCR(), FPMR());
end;
Z{VL}(d) = result;
```

BFCVTNT

Single-precision convert to BFloat16 (top, predicated)

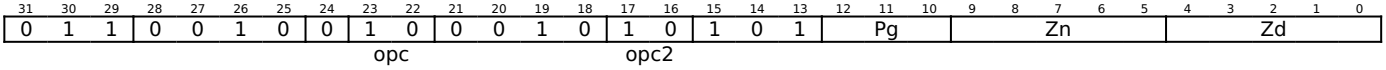
This instruction converts each Active floating-point element of the source vector from single-precision to BFloat16 floating-point, and places the results in the odd-numbered 16-bit elements of the destination vector, leaving the even-numbered elements unchanged. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Merging and Zeroing

Merging

((FEAT_SVE || FEAT_SME) && FEAT_BF16)



Encoding

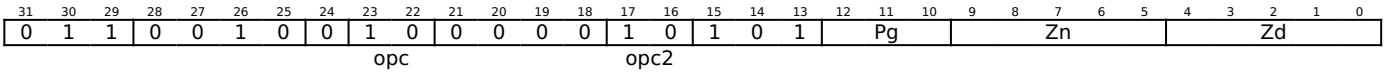
```
BFCVTNT <Zd>.H, <Pg>/M, <Zn>.S
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_BF16)) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

BFDOT (indexed)

BFloat16 dot product by indexed element to single-precision

This instruction delimits the source vectors into pairs of BFloat16 elements. The BFloat16 pairs within the second source vector are specified using an immediate index that selects the same BFloat16 pair position within each 128-bit vector segment. The index range is from 0 to 3.

If FEAT_EBF16 is not implemented or FPCR.EBF is 0, this instruction:

- Performs an unfused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Honors FPCR.AH when generating a default NaN result, otherwise disables alternative floating point behaviors, as if FPCR.AH is 0.

If FEAT_EBF16 is implemented and FPCR.EBF is 1, this instruction:

- Performs a fused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as governed by FPCR.RMode, FPCR.FZ, FPCR.AH, and FPCR.FIZ.

Irrespective of FEAT_EBF16 and FPCR.EBF, this instruction:

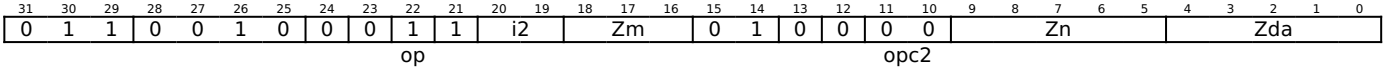
- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Generates only the default NaN, as if FPCR.DN is 1.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

SVE

((FEAT_SVE || FEAT_SME) && FEAT_BF16)



Encoding

```
BFDOT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_BF16)) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let index : integer = UInt(i2);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
let eltspersegment : integer = 128 DIV 32;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let elt1_a : bits(16) = operand1[(2 * e + 0)*:16];
    let elt1_b : bits(16) = operand1[(2 * e + 1)*:16];
    let elt2_a : bits(16) = operand2[(2 * s + 0)*:16];
    let elt2_b : bits(16) = operand2[(2 * s + 1)*:16];
    var sum : bits(32) = operand3[e*:32];

    sum = BFDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
    result[e*:32] = sum;
end;

Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFDOT (vectors)

BFloat16 dot product to single-precision

This instruction delimits the source vectors into pairs of BFloat16 elements.
If FEAT_EBF16 is not implemented or FPCR.EBF is 0, this instruction:

- Performs an unfused sum-of-products of each pair of adjacent BFloat16 elements in the source vectors. The intermediate single-precision products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the source vectors.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Honors FPCR.AH when generating a default NaN result, otherwise disables alternative floating point behaviors, as if FPCR.AH is 0.

If FEAT_EBF16 is implemented and FPCR.EBF is 1, this instruction:

- Performs a fused sum-of-products of each pair of adjacent BFloat16 elements in the source vectors. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the source vectors.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as governed by FPCR.RMode, FPCR.FZ, FPCR.AH, and FPCR.FIZ.

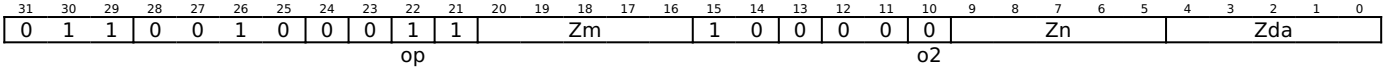
Irrespective of FEAT_EBF16 and FPCR.EBF, this instruction:

- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Generates only the default NaN, as if FPCR.DN is 1.

This instruction is unpredicated.
ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

SVE

((FEAT_SVE || FEAT_SME) && FEAT_BF16)



Encoding

```
BFDOT <Zda>.S, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_BF16)) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let elt1_a : bits(16) = operand1[(2 * e + 0)*:16];
    let elt1_b : bits(16) = operand1[(2 * e + 1)*:16];
    let elt2_a : bits(16) = operand2[(2 * e + 0)*:16];
    let elt2_b : bits(16) = operand2[(2 * e + 1)*:16];

BFMAX

BFloat16 maximum (predicated)

This instruction determines the maximum of Active BFloat16 elements of the first source vector and the corresponding BFloat16 elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

BFMAXNM

BFloat16 maximum number (predicated)

This instruction determines the maximum number value of Active BFloat16 elements of the first source vector and the corresponding BFloat16 elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

BFMLA (indexed)

BFloat16 fused multiply-add by indexed element

This instruction multiplies all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

BFMLALT (indexed)

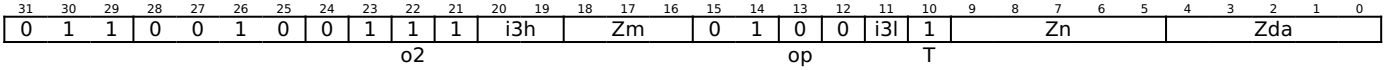
BFloat16 multiply-add by indexed element to single-precision (top)

This instruction widens the odd-numbered BFloat16 elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the single-precision elements of the destination vector that overlap with the corresponding BFloat16 elements in the first source vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

SVE

((FEAT_SVE || FEAT_SME) && FEAT_BF16)



Encoding

```
BFMLALT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_BF16)) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let index : integer = UInt(i3h::i3l);
let op1_neg : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
let eltspersegment : integer = 128 DIV 32;
let op1 : bits(VL) = Z{}(n);
let op2 : bits(VL) = Z{}(m);
let op3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = 2 * segmentbase + index;
    let elem1 : bits(16) = (if op1_neg then BFNeg(op1[(2*e + 1)*:16])
                            else op1[(2*e + 1)*:16]);
    let elem2 : bits(16) = op2[s*:16];
    let elem3 : bits(32) = op3[e*:32];
    result[e*:32] = BFMulAddH(elem3, elem1, elem2, FPCR());
end;

Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFMLS (indexed)

BFloat16 fused multiply-subtract by indexed element

This instruction multiplies all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

BFMLS (vectors)

BFloat16 fused multiply-subtract

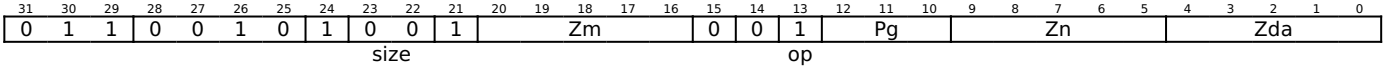
This instruction multiplies the Active BFloat16 elements of the first source vector by the corresponding BFloat16 elements of the second source vector. The results are then subtracted from elements of the third source (addend) vector without intermediate rounding and destructively placed in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

SVE2

(FEAT_SVE_B16B16)



Encoding

```
BFMLS <Zda>.H, <Pg>/M, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_B16B16) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV 16;

BFMMLA (non-widening)

BFloat16 matrix multiply-accumulate

This instruction multiplies the 2x2 matrix of BFloat16 values in each 64-bit segment of the first source vector by the 2x2 matrix of BFloat16 values in the corresponding 64-bit segment of the second source vector. The intermediate products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the 2x2 BFloat16 matrix held in the corresponding 64-bit segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

BFMMLA (widening)

BFloat16 matrix multiply-accumulate to single-precision

This instruction multiplies the 2×4 matrix of BFloat16 values held in each 128-bit segment of the first source vector by the 4×2 matrix of BFloat16 values in the corresponding segment of the second source vector.

If FEAT_EBF16 is not implemented or FPCR.EBF is 0, this instruction:

- Calculates the intermediate single-precision results as a sum of two unfused sum-of-products using two pairs of adjacent BFloat16 values from each of the source vectors, and rounds the results before accumulation into the 2×2 matrix of single-precision results in the corresponding segment of the destination vector. This is equivalent to accumulating a 4-way dot product per destination element.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Honors FPCR.AH when generating a default NaN result, otherwise disables alternative floating point behaviors, as if FPCR.AH is 0.

If FEAT_EBF16 is implemented and FPCR.EBF is 1, this instruction:

- Calculates the intermediate single-precision results as a sum of two fused sum-of-products using two pairs of adjacent BFloat16 values from each of the source vectors, and rounds the results before accumulation into the 2×2 matrix of single-precision results in the destination vector. This is equivalent to accumulating a 4-way dot product per destination element.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as governed by FPCR.RMode, FPCR.FZ, FPCR.AH, and FPCR.FIZ.

Irrespective of FEAT_EBF16 and FPCR.EBF, this instruction:

- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Generates only the default NaN, as if FPCR.DN is 1.

This instruction is unpredicated and vector length agnostic.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

BFMUL (indexed)

BFloat16 multiply by indexed element

This instruction multiplies all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment and places the results in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

SVE2

BIC (immediate)

Bitwise clear bits using immediate (unpredicated)

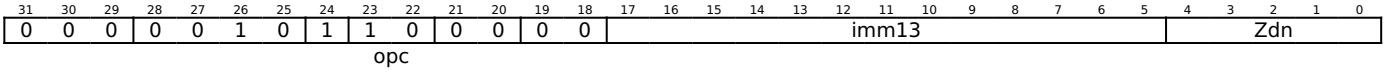
This instruction performs a bitwise clear bits using an immediate with each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of AND (immediate). This means:

- The encodings in this description are named to match the encodings of AND (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of AND (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
BIC <Zdn>.<T>, <Zdn>.<T>, #<const>
```

is equivalent to

```
AND <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

The description of AND (immediate) gives the operational pseudocode for this instruction.

Operational Information

The description of AND (immediate) gives the operational information for this instruction.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 AND (NOT element2);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

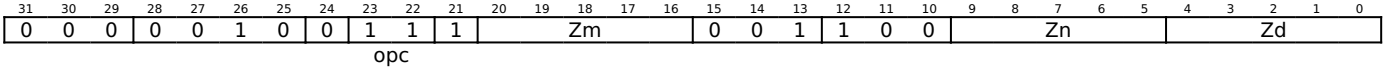
BIC (vectors, unpredicated)

Bitwise clear (unpredicated)

This instruction performs a bitwise AND between the elements of the first source vector and the inverted corresponding elements of the second source vector, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
BIC <Zd>.D, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);

Z{VL}(d) = operand1 AND (NOT operand2);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

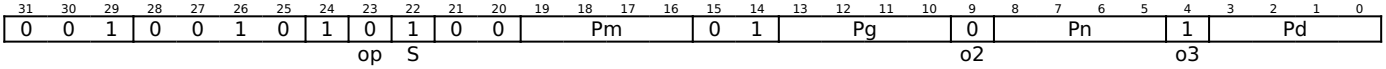
BICS

Bitwise clear predicates, setting the condition flags

This instruction performs a bitwise AND between the Active elements of the first source predicate and the inverted corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
BICS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 AND (NOT element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

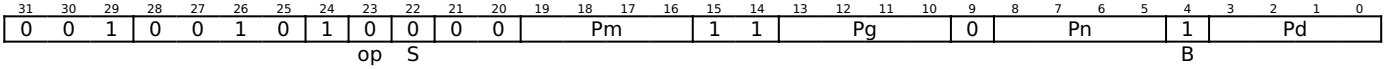
BRKPB

Break before first true condition, propagating from previous partition

This instruction breaks before first true condition, propagating from previous partition. If the Last active element of the first source predicate is false, then the destination predicate is set to all-false. Otherwise, the destination predicate elements up to but not including the First active and true source element are set to true, then the subsequent elements are set to false. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
BRKPB <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
var last : boolean = (LastActive{PL}(mask, operand1, 8) == '1');

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, 8) then
        last = last && (!ActivePredicateElement{PL}(operand2, e, 8));
        let pbit : bit = if last then '1' else '0';
        result[e*:1] = ZeroExtend{1}(pbit);
    else
        result[e*:1] = ZeroExtend{1}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

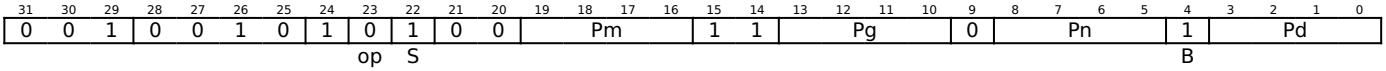
BRKPBS

Break before first true condition, propagating from previous partition and setting the condition flags

This instruction breaks before first true condition, propagating from previous partition, and sets the condition flags. If the Last active element of the first source predicate is false, then the destination predicate is set to all-false. Otherwise, the destination predicate elements up to but not including the First active and true source element are set to true, then the subsequent elements are set to false. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
BRKPBS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
var last : boolean = (LastActive{PL}(mask, operand1, 8) == '1');

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, 8) then
        last = last && (!ActivePredicateElement{PL}(operand2, e, 8));
        let pbit : bit = if last then '1' else '0';
        result[e*:1] = ZeroExtend{1}(pbit);
    else
        result[e*:1] = ZeroExtend{1}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

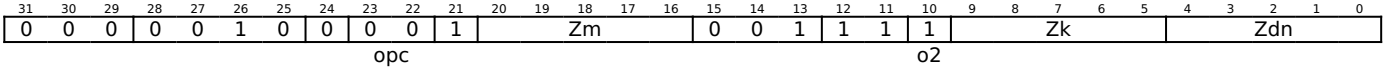
BSL

Bitwise select

This instruction selects bits from the first source vector where the corresponding bit in the third source vector is '1', and from the second source vector where the corresponding bit in the third source vector is '0'. The result is destructively placed in the destination and first source vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
BSL <Zdn>.D, <Zdn>.D, <Zm>.D, <Zk>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let m : integer = UInt(Zm);
let k : integer = UInt(Zk);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(k);

Z{VL}(dn) = (operand1 AND operand3) OR (operand2 AND NOT(operand3));
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

CADD

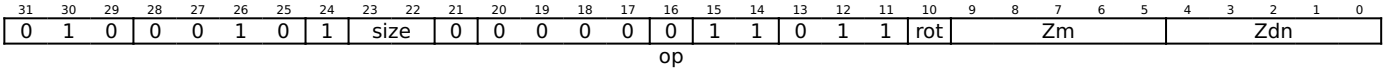
Complex integer add

This instruction adds the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector that have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. The results are destructively placed in the corresponding elements of the first source vector. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
CADD <Zdn>.<T>, <Zdn>.<T>, <Zm>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
let sub_i : boolean = (rot == '0');
let sub_r : boolean = (rot == '1');
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<const> Is the const specifier, encoded in “rot”:

rot	<const>
0	#90
1	#270

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV (2 * esize);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for p = 0 to pairs-1 do
    var acc_r : integer  = SInt(operand1[(2 * p + 0)*:esize]);
    var acc_i : integer  = SInt(operand1[(2 * p + 1)*:esize]);
    let elt2_r : integer = SInt(operand2[(2 * p + 0)*:esize]);
    let elt2_i : integer = SInt(operand2[(2 * p + 1)*:esize]);
    if sub_i then
        acc_r = acc_r - elt2_i;
        acc_i = acc_i + elt2_r;
    end;
    if sub_r then
        acc_r = acc_r + elt2_i;
        acc_i = acc_i - elt2_r;
    end;

    result[(2 * p + 0)*:esize] = acc_r[esize-1:0];
    result[(2 * p + 1)*:esize] = acc_i[esize-1:0];
end;

Z{VL}(dn) = result;
```

Operational information

CDOT (indexed)

Complex integer dot product by indexed element

This instruction delimits the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element that overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums.

The complex numbers in the second source vector are rotated by 0, 90, 180, or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

- If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
- If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
- If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
- If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

The indexed form of these instructions select a single pair of complex numbers within each 128-bit segment of the second source vector as the multiplier for all pairs of complex numbers within the corresponding 128-bit segment of the first source vector. The complex number pairs within the second source vector are specified using an immediate index that selects the same complex number pair position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex number pairs per 128-bit segment.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 8-bit to 32-bit and 16-bit to 64-bit

8-bit to 32-bit

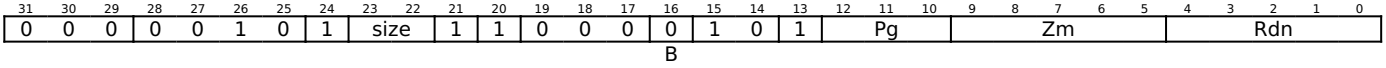
CLASTA (scalar)

Conditionally extract element after last to general-purpose register

This instruction extracts and zero-extends the element after the Last active element, or if the Last active element is the final element it extracts element zero, from the source vector register, and destructively places the zero-extended value in the destination and first source general-purpose register. If there are no Active elements, the least significant element-size bits of the destination and first source general-purpose register are destructively zero-extended.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
CLASTA <R><dn>, <Pg>, <R><dn>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Rdn);
let m : integer = UInt(Zm);
let csize : integer{} = if esize < 64 then 32 else 64;
let isBefore : boolean = FALSE;
```

Assembler Symbols

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<dn> Is the number [0-30] of the source and destination general-purpose register or the name ZR (31), encoded in the "Rdn" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the source scalable vector register, encoded in the "Zm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(esize) = X{}(dn);
let operand2 : bits(VL) = Z{}(m);
var result : bits(csize);
var last : integer = LastActiveElement{PL}(mask, esize);

if last < 0 then
    result = ZeroExtend{csize}(operand1);
else
    if !isBefore then
        last = last + 1;
        if last >= elements then last = 0; end;
    end;
    result = ZeroExtend{csize}(operand2[last*:esize]);

end;
X{csize}(dn) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

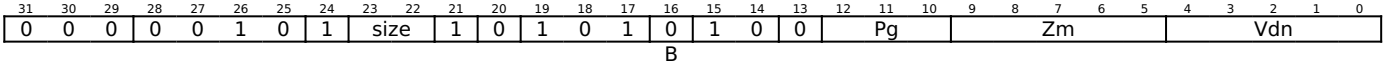
CLASTA (SIMD&FP scalar)

Conditionally extract element after last to SIMD&FP scalar register

This instruction extracts and zero-extends the element after the Last active element, or if the Last active element is the final element it extracts element zero, from the source vector register, and destructively places the zero-extended value in the destination and first source SIMD & floating-point scalar register. If there are no Active elements, the least significant element-size bits of the destination and first source SIMD & floating-point scalar register are destructively zero-extended.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
CLASTA <V><dn>, <Pg>, <V><dn>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Vdn);
let m : integer = UInt(Zm);
let isBefore : boolean = FALSE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<dn> Is the number [0-31] of the source and destination SIMD&FP register, encoded in the "Vdn" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the source scalable vector register, encoded in the "Zm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);

CLS

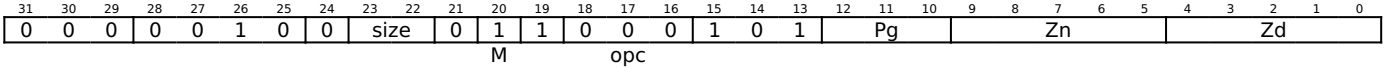
Count leading sign bits (predicated)

This instruction determines the number of consecutive sign bits, starting from the most significant bit in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

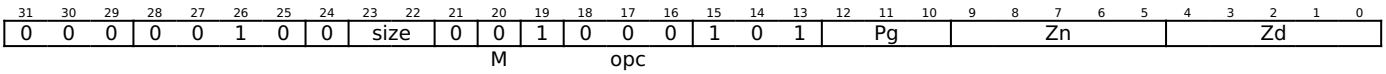
```
CLS <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
CLS <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = CountLeadingSignBits(element)[esize-1:0];

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

CMLA (indexed)

Complex integer multiply-add by indexed element

This instruction multiplies the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180, or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

This instruction then adds the products to the corresponding components of the complex numbers in the addend vector, and destructively places the results in the corresponding elements of the addend vector. This instruction is unpredicated.

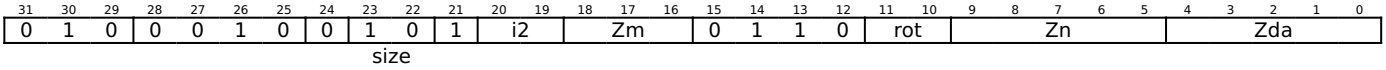
These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 16-bit and 32-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

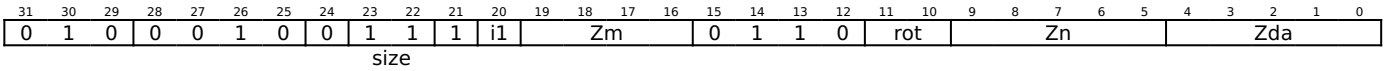
```
CMLA <Zda>.H, <Zn>.H, <Zm>.H[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel_a : integer = UInt(rot[0]);
let sel_b : integer = UInt(NOT(rot[0]));
let sub_r : boolean = (rot[0] != rot[1]);
let sub_i : boolean = (rot[1] == '1');
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
CMLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel_a : integer = UInt(rot[0]);
let sel_b : integer = UInt(NOT(rot[0]));
let sub_r : boolean = (rot[0] != rot[1]);
let sub_i : boolean = (rot[1] == '1');
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field.

For the "32-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

<const> Is the const specifier, encoded in “rot”:

rot	<const>
00	#0
01	#90
10	#180
11	#270

Operation

```
CheckSVEEnabled();

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

CMLA (vectors)

Complex integer multiply-add

This instruction multiplies the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180, or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

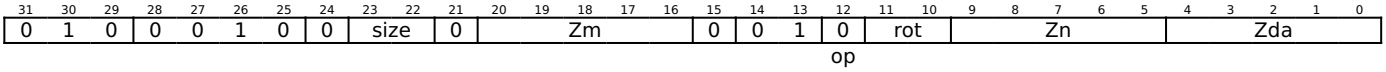
This instruction then adds the products to the corresponding components of the complex numbers in the addend vector, and destructively places the results in the corresponding elements of the addend vector. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
CMLA <Zda>.<T>, <Zn>.<T>, <Zm>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);

```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.

CMPLE (vectors)

Compare signed less than or equal to vector, setting the condition flags

This instruction compares Active signed integer elements in the first source vector being less than or equal to the corresponding signed elements in the second source vector, and places the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This is a pseudo-instruction of CMP<cc> (vectors). This means:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Greater than or equal

(FEAT_SVE || FEAT_SME)

CNOT

Logically invert boolean condition (predicated)

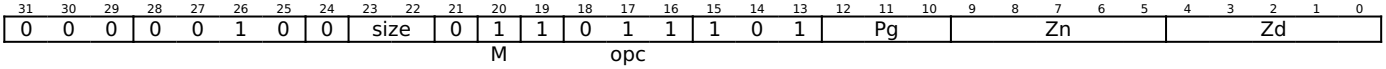
This instruction logically inverts the boolean value in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

Boolean TRUE is any nonzero value in a source, and one in a result element. Boolean FALSE is always zero.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

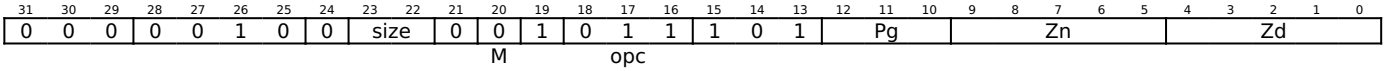
```
CNOT <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
CNOT <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = ZeroExtend{esize}(IsZeroBit{esize}(element));

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

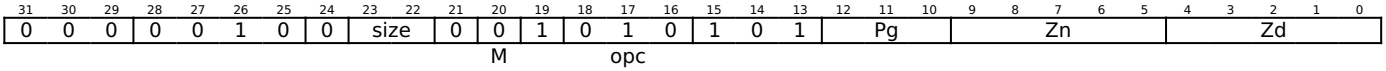
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
CNT <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = BitCount(element)[esize-1:0];

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

CNTB, CNTD, CNTH, CNTW

Set scalar to multiple of predicate constraint element count

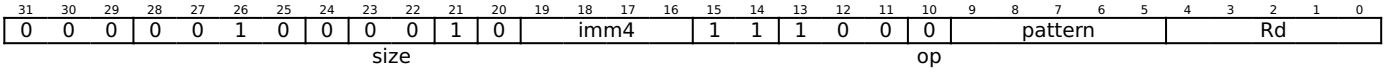
This instruction determines the number of Active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 4 classes: Byte , Doubleword , Halfword and Word

Byte

(FEAT_SVE || FEAT_SME)



Encoding

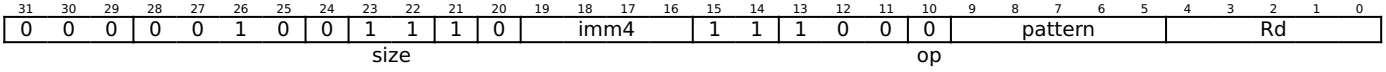
```
CNTB <Xd>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let d : integer = UInt(Rd);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Doubleword

(FEAT_SVE || FEAT_SME)



Encoding

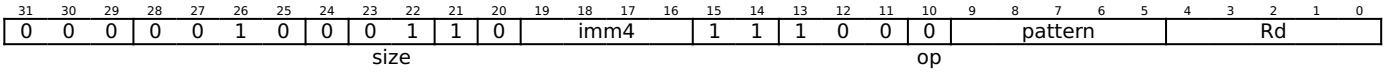
```
CNTD <Xd>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let d : integer = UInt(Rd);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Halfword

(FEAT_SVE || FEAT_SME)



Encoding

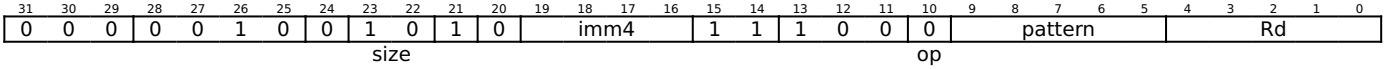
```
CNTH <Xd>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let d : integer = UInt(Rd);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Word

(FEAT_SVE || FEAT_SME)



Encoding

```
CNTW <Xd>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let d : integer = UInt(Rd);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let count : integer = DecodePredCount(pat, esize);
X{64}(d) = (count * imm)[63:0];
```

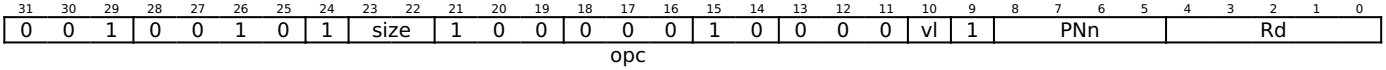
CNTP (predicate as counter)

Set scalar to count from predicate-as-counter

This instruction determines the number of true elements in the source predicate, up to the total number of elements in two or four vectors, and places the scalar result in the destination general-purpose register.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
CNTP <Xd>, <PNn>.<T>, <vl>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(PNn);
let d : integer = UInt(Rd);
let width : integer = 2 << UInt(vl);
```

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.

<PNn> Is the name of the source scalable predicate register, with predicate-as-counter encoding, encoded in the "PNn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<vl> Is the vl specifier, encoded in “vl”:

vl	<vl>
0	VLx2
1	VLx4

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then CheckSVEEnabled(); else CheckStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let pred : bits(PL) = P{}(n);
let mask : bits(PL*4) = CounterToPredicate{}(pred[15:0]);
var sum : bits(64) = Zeros{};
let maxelements : integer = elements * width;

for e = 0 to maxelements-1 do
    if ActivePredicateElement{PL*4}(mask, e, esize) then
        sum = sum + 1;
    end;
end;
X{64}(d) = sum;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

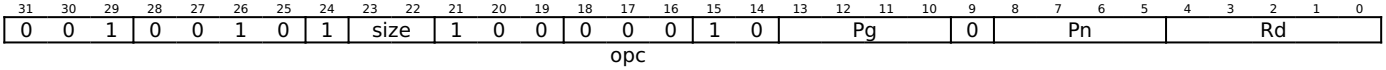
CNTP (predicate)

Set scalar to count of true predicate elements

This instruction determines the number of Active and true elements in the source predicate and places the scalar result in the destination general-purpose register. Inactive predicate elements are not counted.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
CNTP <Xd>, <Pg>, <Pn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let d : integer = UInt(Rd);
```

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(PL) = P{}(n);
var sum : bits(64) = Zeros{};

for e = 0 to elements-1 do
    if (ActivePredicateElement{PL}(mask, e, esize)
         && ActivePredicateElement{PL}(operand, e, esize)) then
        sum = sum + 1;
    end;
end;
X{64}(d) = sum;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

COMPACT

Copy Active vector elements to lower-numbered elements

This instruction copies Active elements from the source vector to consecutive elements of the destination vector, in increasing order of element number, and sets any remaining elements to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled, or FEAT_SME2p2 is implemented.

It has encodings from 2 classes: Byte and halfword and Word and doubleword

Byte and halfword

(FEAT_SVE2p2 || FEAT_SME2p2)

Encoding

```
COMPACT <Zd>.<T>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(sz);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Word and doubleword

(FEAT_SVE || FEAT_SME2p2)

Encoding

```
COMPACT <Zd>.<T>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the "Byte and halfword" variant: is the size specifier, encoded in “sz”:

sz	<T>
0	B
1	H

For the "Word and doubleword" variant: is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2p2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = Zeros{};
var x : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand1[e*:esize];
        result[x*:esize] = element;
        x = x + 1;
    end;
end;

Z{VL}(d) = result;
```

CPY (immediate, merging)

Copy signed integer immediate to vector elements (merging)

This instruction copies a signed integer immediate to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

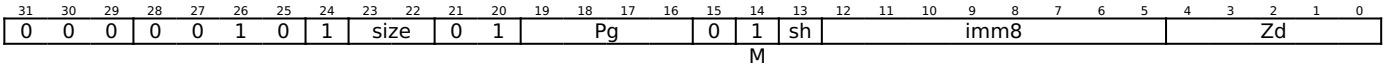
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias MOV (immediate, merging).

This instruction is used by the pseudo-instruction FMOV (zero, predicated).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
CPY <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
var imm : integer = SInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Alias Conditions

Alias	Is preferred when
FMOV (zero, predicated)	`Never`
MOV (immediate, merging)	`Unconditionally`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let dest : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = imm[esize-1:0];
    else
        result[e*:esize] = dest[e*:esize];
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

CPY (immediate, zeroing)

Copy signed integer immediate to vector elements (zeroing)

This instruction copies a signed integer immediate to each Active element in the destination vector. Inactive elements in the destination vector register are set to zero.

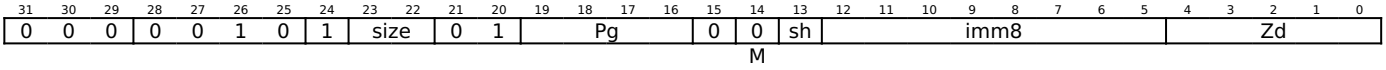
The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias MOV (immediate, zeroing).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
CPY <Zd>.<T>, <Pg>/Z, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
var imm : integer = SInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let dest : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = imm[esize-1:0];
    else
        result[e*:esize] = dest[e*:esize];
    end;
end;

Z{VL}(d) = result;
```

CPY (scalar)

Copy general-purpose register to vector elements (predicated)

This instruction copies the general-purpose scalar source register to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.
This instruction is used by the alias MOV (scalar, predicated).

SVE

(FEAT_SVE || FEAT_SME)

Encoding for the 32-bit variant

Applies when `(size != 11)`

```
CPY <Zd>.<T>, <Pg>/M, <Wn|WSP>
```

Encoding for the 64-bit variant

Applies when `(size == 11)`

```
CPY <Zd>.D, <Pg>/M, <Xn|SP>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var result : bits(VL) = Z{}(d);
if AnyActiveElement{PL}(mask, esize) then
    var operand1 : bits(64);
    if n == 31 then
        operand1 = SP{64}();
    else
        operand1 = X{64}(n);
    end;

    for e = 0 to elements-1 do
        if ActivePredicateElement{PL}(mask, e, esize) then
            result[e*:esize] = operand1[esize-1:0];
        end;
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

CPY (SIMD&FP scalar)

Copy SIMD&FP scalar register to vector elements (predicated)

This instruction copies the SIMD & floating-point scalar source register to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.
This instruction is used by the alias MOV (SIMD&FP scalar, predicated).

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
CPY <Zd>.<T>, <Pg>/M, <V><n>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Vn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(esize) = (if AnyActiveElement{PL}(mask, esize) then
                              V{esize}(n) else Zeros{esize});
var result : bits(VL) = Z{}(d);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = operand1;
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.

- A predicated `MOVPRFX` must use the same governing predicate register as this instruction.
- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

CTERMEQ, CTERMNE

Compare and terminate loop

This instruction detects termination conditions in serialized vector loops by testing whether the comparison between the scalar source operands holds true. If the comparison is not successful, the instruction tests the state of the !Last condition flag (C), which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.

The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:

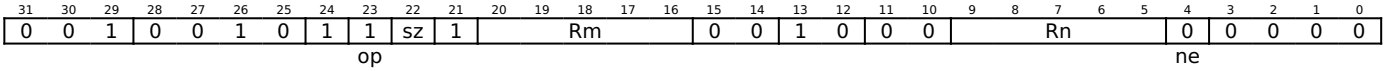
Condition	N	V	Meaning
GE	0	0	Continue loop (compare failed and last element not selected)
LT	0	1	Terminate loop (last element selected)
LT	1	0	Terminate loop (compare succeeded)
GE	1	1	Never generated

The scalar source operands are 32-bit or 64-bit general-purpose registers of the same size.

It has encodings from 2 classes: Equal and Not equal

Equal

(FEAT_SVE || FEAT_SME)



Encoding

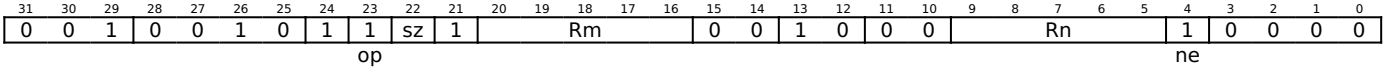
```
CTERMEQ <R><n>, <R><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let cmp_op : CmpOp = Cmp_EQ;
```

Not equal

(FEAT_SVE || FEAT_SME)



Encoding

```
CTERMNE <R><n>, <R><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let cmp_op : CmpOp = Cmp_NE;
```

Assembler Symbols

<R> Is a width specifier, encoded in “sz”:

sz	<R>
0	W
1	X

<n> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rn" field.

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
let operand1 : bits(esize) = X{}(n);
let operand2 : bits(esize) = X{}(m);
let element1 : integer = UInt(operand1);
let element2 : integer = UInt(operand2);
var term : boolean;

case cmp_op of
    when Cmp_EQ => term = element1 == element2;
    when Cmp_NE => term = element1 != element2;
end;
if term then
    PSTATE.N = '1';
    PSTATE.V = '0';
else
    PSTATE.N = '0';
    PSTATE.V = (NOT PSTATE.C);
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

DECB, DECD, DECH, DECW (scalar)

Decrement scalar by multiple of predicate constraint element count

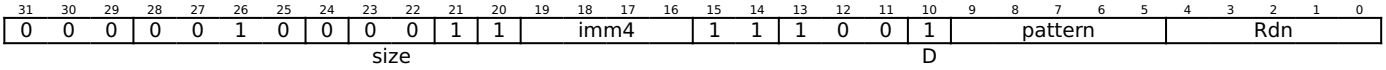
This instruction determines the number of Active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 4 classes: Byte , Doubleword , Halfword and Word

Byte

(FEAT_SVE || FEAT_SME)



Encoding

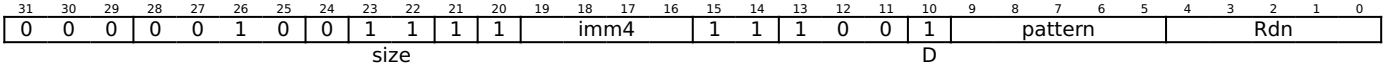
```
DECB <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Doubleword

(FEAT_SVE || FEAT_SME)



Encoding

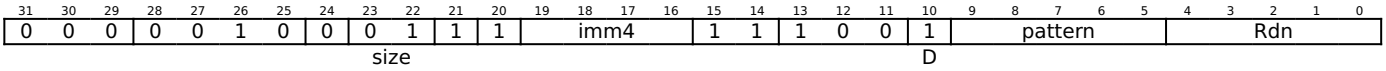
```
DECD <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Halfword

(FEAT_SVE || FEAT_SME)



Encoding

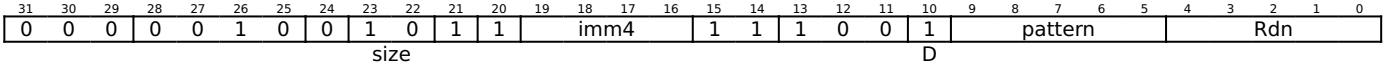
```
DECH <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Word

(FEAT_SVE || FEAT_SME)



Encoding

```
DECW <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let count : integer = DecodePredCount(pat, esize);
let VL : integer{} = CurrentVL();
let operand1 : bits(64) = X{}(dn);
X{64}(dn) = operand1 - (count * imm);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

DECD, DECH, DECW (vector)

Decrement vector by multiple of predicate constraint element count

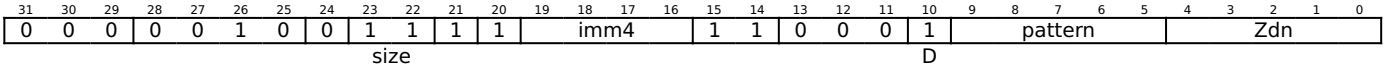
This instruction determines the number of Active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 3 classes: Doubleword , Halfword and Word

Doubleword

(FEAT_SVE || FEAT_SME)



Encoding

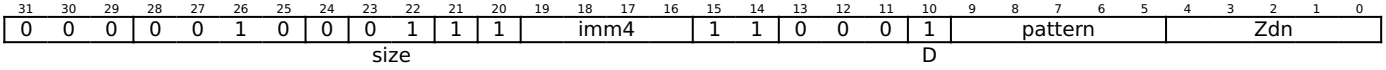
```
DECD <Zdn>.D{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Halfword

(FEAT_SVE || FEAT_SME)



Encoding

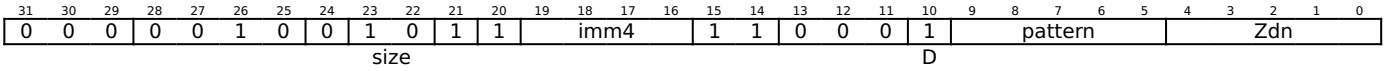
```
DECH <Zdn>.H{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Word

(FEAT_SVE || FEAT_SME)



Encoding

```
DECW <Zdn>.S{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let count : integer = DecodePredCount(pat, esize);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    result[e*:esize] = operand1[e*:esize] - (count * imm);

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

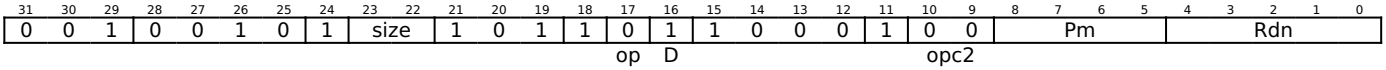
DECP (scalar)

Decrement scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to decrement the scalar destination.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
DECP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(64) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

X{64}(dn) = operand1 - count;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

DECP (vector)

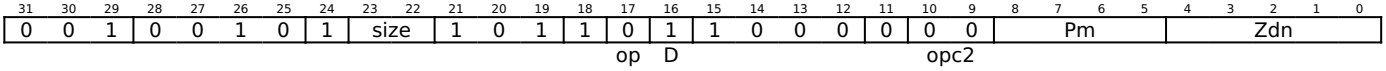
Decrement vector by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
DECP <Zdn>.<T>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(VL);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

for e = 0 to elements-1 do
    result[e*:esize] = operand1[e*:esize] - count;

end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

DUP (immediate)

Broadcast signed immediate to vector elements (unpredicated)

This instruction unconditionally broadcasts the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

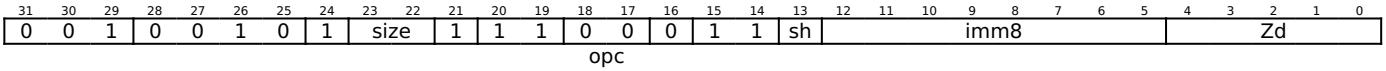
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias MOV (immediate, unpredicated).

This instruction is used by the pseudo-instruction FMOV (zero, unpredicated).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
DUP <Zd>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Zd);
var imm : integer = SInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Alias Conditions

Alias	Is preferred when
FMOV (zero, unpredicated)	Never
MOV (immediate, unpredicated)	Unconditionally

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let result : bits(VL) = Replicate{}(imm[esize-1:0]);
Z{VL}(d) = result;
```

DUP (indexed)

Broadcast indexed element to vector (unpredicated)

This instruction unconditionally broadcasts the indexed source vector element into each element of the destination vector. This instruction is unpredicated.

The immediate element index is in the range of 0 to 63 (bytes), 31 (halfwords), 15 (words), 7 (doublewords) or 3 (quadwords). Selecting an element beyond the accessible vector length causes the destination vector to be set to zero.

This instruction is used by the alias MOV (SIMD&FP scalar, unpredicated).

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
DUP <Zd>.<T>, <Zn>.<T>[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if tsz == '00000' then EndOfDecode(Decode_UNDEF); end;
let lsb : integer{} = LowestSetBit(tsz);
let esize : integer{} = 8 << lsb;
let imm : bits(7) = imm2::tsz;
let index : integer = UInt(imm[6:(lsb+1)]);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsz”:

tsz	<T>
00000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D
10000	Q

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 512 bits, encoded in "imm2:tsz".

Alias Conditions

Alias	Is preferred when
MOV (SIMD&FP scalar, unpredicated)	`BitCount(imm2 :: tsz) == 1`
MOV (SIMD&FP scalar, unpredicated)	`BitCount(imm2 :: tsz) > 1`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = if index < elements then Z{VL}(n) else Zeros{VL};
var result : bits(VL);
var element : bits(esize);

if index >= elements then
    element = Zeros{esize};
else
    element = operand1[index*:esize];
end;
result = Replicate{VL}(element);

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

DUP (scalar)

Broadcast general-purpose register to vector elements (unpredicated)

This instruction unconditionally broadcasts the general-purpose scalar source register into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias MOV (scalar, unpredicated).

SVE

(FEAT_SVE || FEAT_SME)

Encoding for the 32-bit variant

Applies when `(size != 11)`

```
DUP <Zd>.<T>, <Wn|WSP>
```

Encoding for the 64-bit variant

Applies when `(size == 11)`

```
DUP <Zd>.D, <Xn|SP>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Rn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S

<Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var operand : bits(64);
if n == 31 then
    operand = SP{64}();
else
    operand = X{64}(n);
end;
var result : bits(VL);

for e = 0 to elements-1 do
    result[e*:esize] = operand[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DUPM

Broadcast logical bitmask immediate to vector (unpredicated)

This instruction unconditionally broadcasts the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits.

This instruction is used by the alias MOV.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
DUPM <Zd>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let d : integer = UInt(Zd);
var imm : bits(esize);
(imm, -) = DecodeBitMasks{esize}(imm13[12], imm13[5:0], imm13[11:6], TRUE);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Alias Conditions

Alias	Is preferred when
MOV	`SVEMoveMaskPreferred(imm13)`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let result : bits(VL) = Replicate{}(imm);
Z{VL}(d) = result;
```

DUPQ

Broadcast indexed element within each quadword vector segment (unpredicated)

This instruction unconditionally broadcasts the indexed element within each 128-bit source vector segment to all elements of the corresponding destination vector segment. This instruction is unpredicated.

The immediate element index is in the range of 0 to 15 (bytes), 7 (halfwords), 3 (words) or 1 (doublewords).

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)

Encoding

```
DUPQ <Zd>.<T>, <Zn>.<T>[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
if tsz == '0000' then EndOfDecode(Decode_UNDEF); end;
let lsb : integer{} = LowestSetBit(tsz);
let esize : integer{} = 8 << lsb;
let imm : bits(5) = i1::tsz;
let index : integer = UInt(imm[4:(lsb+1)]);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsz”:

tsz	<T>
0000	RESERVED
xxx1	B
xx10	H
x100	S
1000	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 128 bits, encoded in "i1:tsz".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let elements : integer = 128 DIV esize;
let operand : bits(VL) = Z{}(n);
var result : bits(VL);
var element : bits(esize);

for s = 0 to segments-1 do
    element = operand[(s * elements + index)*:esize];
    result[s*:128] = Replicate{128}(element);
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

EON

Bitwise exclusive-OR with inverted immediate (unpredicated)

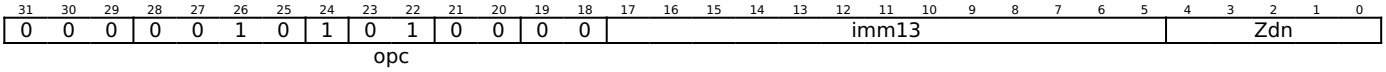
This instruction performs a bitwise exclusive-OR between an inverted immediate and each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of EOR (immediate). This means:

- The encodings in this description are named to match the encodings of EOR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of EOR (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
EON <Zdn>.<T>, <Zdn>.<T>, #<const>
```

is equivalent to

```
EOR <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

The description of EOR (immediate) gives the operational pseudocode for this instruction.

Operational Information

The description of EOR (immediate) gives the operational information for this instruction.

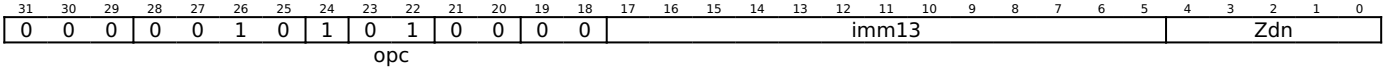
EOR (immediate)

Bitwise exclusive-OR with immediate (unpredicated)

This instruction performs a bitwise exclusive-OR between an immediate and each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.
This instruction is used by the pseudo-instruction EON.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
EOR <Zdn>.<T>, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn);
var imm : bits(64);
(imm, -) = DecodeBitMasks{64}(imm13[12], imm13[5:0], imm13[11:6], TRUE);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand[e*:64];
    result[e*:64] = element1 XOR imm;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

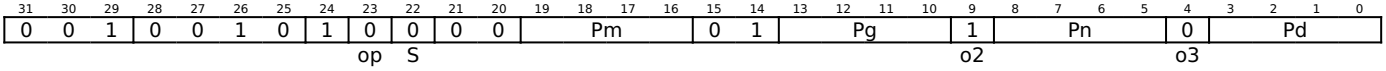
EOR (predicates)

Bitwise exclusive-OR predicates

This instruction performs a bitwise exclusive-OR between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.
This instruction is used by the alias NOT (predicate).

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
EOR <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
NOT (predicate)	`Pm == Pg`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 XOR element2);
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

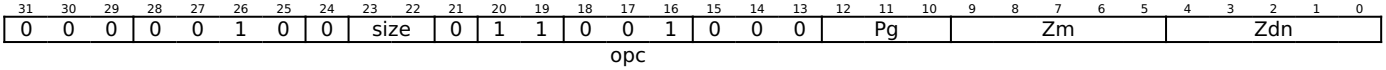
EOR (vectors, predicated)

Bitwise exclusive-OR (predicated)

This instruction performs a bitwise exclusive-OR between the Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
EOR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 XOR element2;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

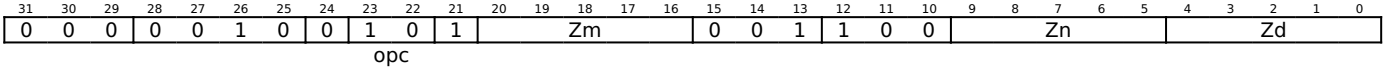
EOR (vectors, unpredicated)

Bitwise exclusive-OR (unpredicated)

This instruction performs a bitwise exclusive-OR between the elements of the first source vector and the corresponding elements of the second source vector, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
EOR <Zd>.D, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);

Z{VL}(d) = operand1 XOR operand2;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

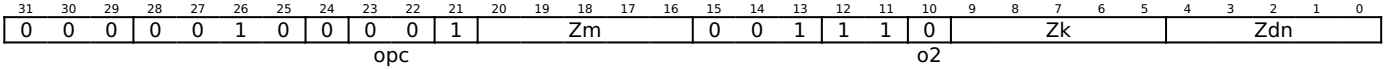
EOR3

Bitwise exclusive-OR between three vectors

This instruction performs a bitwise exclusive-OR between the corresponding elements of the three source vectors, and destructively places the results in the corresponding elements of the destination and first source vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
EOR3 <Zdn>.D, <Zdn>.D, <Zm>.D, <Zk>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let m : integer = UInt(Zm);
let k : integer = UInt(Zk);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(k);

Z{VL}(dn) = operand1 XOR operand2 XOR operand3;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

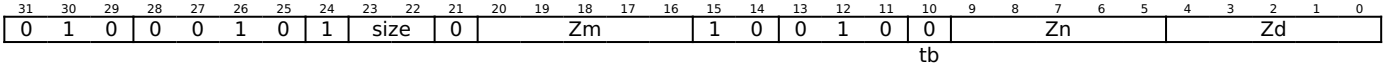
EORBT

Interleaving exclusive-OR (bottom, top)

This instruction performs an interleaving exclusive-OR between the even-numbered elements of the first source vector register and the odd-numbered elements of the second source vector register, placing the result in the even-numbered elements of the destination vector, leaving the odd-numbered elements unchanged. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
EORBT <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel1 : integer = 0;
let sel2 : integer = 1;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(d);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[(2*e + sel1)*:esize];
    let element2 : bits(esize) = operand2[(2*e + sel2)*:esize];
    result[(2*e + sel1)*:esize] = element1 XOR element2;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.

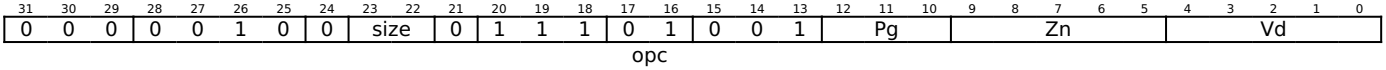
EORQV

Bitwise exclusive-OR reduction of quadword vector segments

This instruction performs a bitwise exclusive-OR between elements in the same position from each 128-bit source vector segment, and places each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as all zeros.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
EORQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<Vd> Is the name of the destination SIMD&FP register, encoded in the "Vd" field.

<T> Is an arrangement specifier, encoded in “size”:

size	<T>
00	16B
01	8H
10	4S
11	2D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let segments : integer = VL DIV 128;
let elempersegment : integer = 128 DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(128) = Zeros{};
var stmp : bits(128) = Zeros{};

var dtmp : bits(esize);

for e = 0 to elempersegment-1 do
    dtmp = Zeros{esize};
    for s = 0 to segments-1 do
        if ActivePredicateElement{PL}(mask, s * elempersegment + e, esize) then
            stmp = operand[s*:128];
            dtmp = dtmp XOR stmp[e*:esize];
        end;
    end;
    result[e*:esize] = dtmp[esize-1:0];
end;

V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

EORS

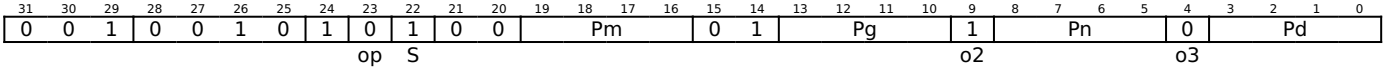
Bitwise exclusive-OR predicates, setting the condition flags

This instruction performs a bitwise exclusive-OR between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This instruction is used by the alias NOTS.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
EORS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
NOTS	`Pm == Pg`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 XOR element2);
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

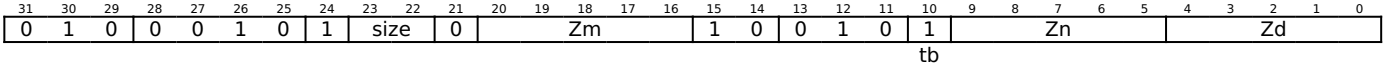
EORTB

Interleaving exclusive-OR (top, bottom)

This instruction performs an interleaving exclusive-OR between the odd-numbered elements of the first source vector register and the even-numbered elements of the second source vector register, placing the result in the odd-numbered elements of the destination vector, leaving the even-numbered elements unchanged. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
EORTB <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel1 : integer = 1;
let sel2 : integer = 0;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(d);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[(2*e + sel1)*:esize];
    let element2 : bits(esize) = operand2[(2*e + sel2)*:esize];
    result[(2*e + sel1)*:esize] = element1 XOR element2;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

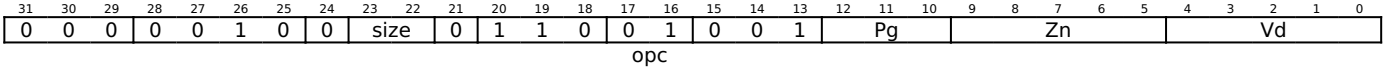
EORV

Bitwise exclusive-OR reduction to scalar

This instruction performs a bitwise exclusive-OR between the elements of the source vector, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as zero.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
EORV <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(esize) = Zeros{esize};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result = result XOR operand[e*:esize];

    end;
end;
V{esize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

EXPAND

Copy lower-numbered vector elements to Active elements

This instruction copies consecutive elements from the source vector to Active elements of the destination vector, in increasing order of element number. Inactive elements in the destination vector register are set to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled, or FEAT_SME2p2 is implemented.

SVE2

(FEAT_SVE2p2 || FEAT_SME2p2)

Encoding

```
EXPAND <Zd>.<T>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2p2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;

EXT

Extract vector from pair of vectors

This instruction copies the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fills the remainder of the result starting from the first byte of the second source vector. The result is destructively placed in the destination and first source vector, or constructively placed in the destination vector. This instruction is unpredicated.

An index that is greater than or equal to the vector length in bytes is treated as zero, resulting in the first source vector being copied to the result unchanged.

It has encodings from 2 classes: Constructive and Destructive

Constructive

(FEAT_SVE2 || FEAT_SME)

Encoding

```
EXT <Zd>.B, { <Zn1>.B, <Zn2>.B }, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dst : integer = UInt(Zd);
let s1 : integer = UInt(Zn);
let s2 : integer = (s1 + 1) MOD 32;
let position : integer{} = UInt(imm8h::imm8l) * 8;
```

Destructive

(FEAT_SVE || FEAT_SME)

Encoding

```
EXT <Zdn>.B, <Zdn>.B, <Zm>.B, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dst : integer = UInt(Zdn);
let s1 : integer = dst;
let s2 : integer = UInt(Zm);
let position : integer{} = UInt(imm8h::imm8l) * 8;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded in the "Zn" field.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded in the "Zn" field.
<imm>	Is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8h:imm8l" fields.
<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(s1);
let operand2 : bits(VL) = Z{}(s2);
var result : bits(VL);

let concat : bits(VL*2) = operand2 :: operand1;

if position >= VL then
    result = concat[VL-1:0];
else
    result = concat[(position+VL)-1:position];
end;

Z{VL}(dst) = result;
```

Operational information

For the "Constructive" variant:

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

For the "Destructive" variant:

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The destructive variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the destructive variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

EXTQ

Extract vector segment from each pair of quadword vector segments

This instruction copies, for each 128-bit vector segment of the result, the indexed byte up to and including the last byte of the corresponding first source vector segment to the bottom of the result segment, and then fills the remainder of the result segment starting from the first byte of the corresponding second source vector segment. The result segments are destructively placed in the corresponding first source vector segment. This instruction is unpredicated.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)

Encoding

```
EXTQ <Zdn>.B, <Zdn>.B, <Zm>.B, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let position : integer{} = UInt(imm4) << 3;
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<imm>	Is the unsigned immediate operand, in the range 0 to 15, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for s = 0 to segments-1 do
    let concat : bits(256) = operand2[s*:128] :: operand1[s*:128];
    result[s*:128] = concat[position+127:position];
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

F1CVT, F2CVT

8-bit floating-point convert to half-precision

This instruction converts each even-numbered 8-bit floating-point element of the source vector to half-precision while downscaling the value, and places the results in the overlapping 16-bit elements of the destination vector. F1CVT scales the values by $2^{-UInt(FPMR.LSCALE[3:0])}$. F2CVT scales the values by $2^{-UInt(FPMR.LSCALE2[3:0])}$.

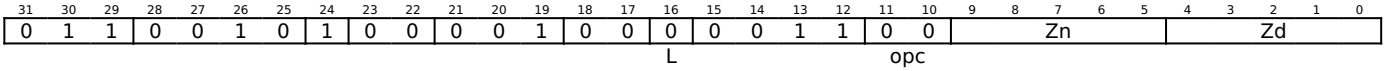
The 8-bit floating-point encoding format for F1CVT is selected by FPMR.F8S1. The 8-bit floating-point encoding format for F2CVT is selected by FPMR.F8S2.

This instruction is unpredicated.

It has encodings from 2 classes: F1CVT and F2CVT

F1CVT

((FEAT_SVE2 || FEAT_SME2) && FEAT_FP8)



Encoding

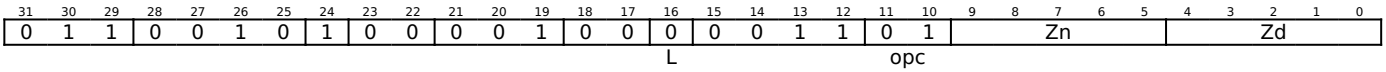
```
F1CVT <Zd>.H, <Zn>.B
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_FP8)) then EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let s_esize : integer{} = 8;
let d_esize : integer{} = 16;
let issrc2 : boolean = FALSE;
```

F2CVT

((FEAT_SVE2 || FEAT_SME2) && FEAT_FP8)



Encoding

```
F2CVT <Zd>.H, <Zn>.B
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_FP8)) then EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let s_esize : integer{} = 8;
let d_esize : integer{} = 16;
let issrc2 : boolean = TRUE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckFPMREnabled();
if IsFeatureImplemented(FEAT_SME2) then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand : bits(VL) = Z{}(n);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : bits(esize) = operand[e*:esize];
    let res : bits(d_esize) = FP8ConvertFP(element[s_esize-1:0], issrc2, FPCR(), FPMR());
    result[e*:esize] = ZeroExtend{esize}(res);
end;

Z{VL}(d) = result;
```

F1CVTLT, F2CVTLT

8-bit floating-point convert to half-precision (top)

This instruction converts each odd-numbered 8-bit floating-point element of the source vector to half-precision while downscaling the value, and places the results in the overlapping 16-bit elements of the destination vector. F1CVTLT scales the values by $2^{-UInt(FPMR.LSCALE[3:0])}$. F2CVTLT scales the values by $2^{-UInt(FPMR.LSCALE2[3:0])}$.

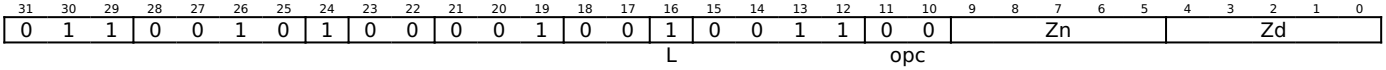
The 8-bit floating-point encoding format for F1CVTLT is selected by FPMR.F8S1. The 8-bit floating-point encoding format for F2CVTLT is selected by FPMR.F8S2.

This instruction is unpredicated.

It has encodings from 2 classes: F1CVTLT and F2CVTLT

F1CVTLT

((FEAT_SVE2 || FEAT_SME2) && FEAT_FP8)



Encoding

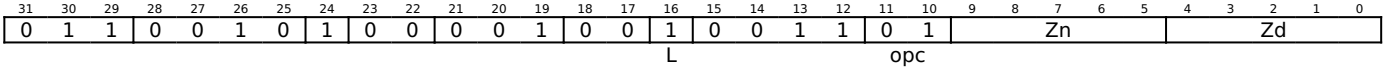
```
F1CVTLT <Zd>.H, <Zn>.B
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_FP8)) then EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let issrc2 : boolean = FALSE;
```

F2CVTLT

((FEAT_SVE2 || FEAT_SME2) && FEAT_FP8)



Encoding

```
F2CVTLT <Zd>.H, <Zn>.B
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_FP8)) then EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let issrc2 : boolean = TRUE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckFPMREnabled();
if IsFeatureImplemented(FEAT_SME2) then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand : bits(VL) = Z{}(n);
var result : bits(VL);
for e = 0 to elements-1 do
    let element : bits(esize DIV 2) = operand[(2*e + 1)*:(esize DIV 2)];
    result[e*:esize] = FP8ConvertFP(element, issrc2, FPCR(), FPMR());

end;
Z{VL}(d) = result;
```

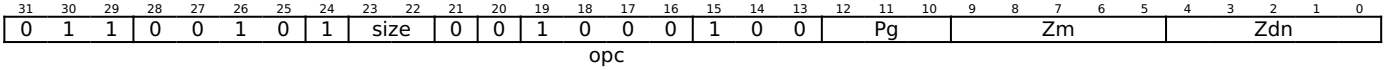
FABD

Floating-point absolute difference (predicated)

This instruction calculates the absolute difference of Active floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and destructively places the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FABD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);

let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPAbs{esize}(FPSub{esize}(element1, element2, FPCR()), FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FABS

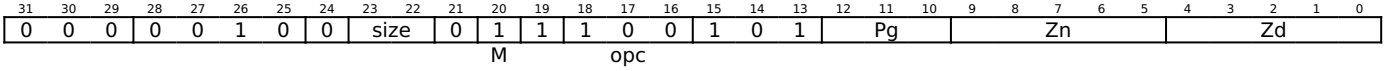
Floating-point absolute value (predicated)

This instruction takes the absolute value of each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. This clears the sign bit and cannot signal a floating-point exception. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

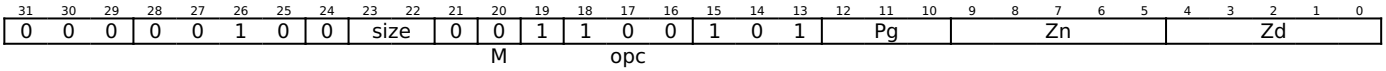
```
FABS <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FABS <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPAbs{esize}(element, FPCR());

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

FAC<cc>

Floating-point absolute compare

This instruction compares Active absolute values of floating-point elements in the first source vector with the corresponding absolute values of elements in the second source vector, and places the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

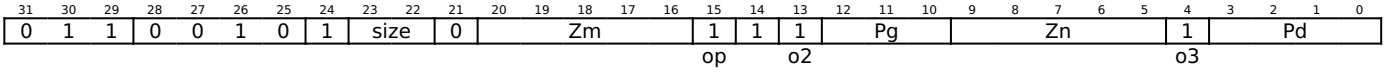
<cc>	Comparison
GE	greater than or equal
GT	greater than
LE	less than or equal
LT	less than

This instruction is used by the pseudo-instructions FACLE, and FACLT.

It has encodings from 2 classes: Greater than and Greater than or equal

Greater than

(FEAT_SVE || FEAT_SME)



Encoding

```
FACGT <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
