SUDOT (4-way, multiple and single vector)

Multi-vector signed by unsigned 8-bit integer dot product by vector to 32-bit integer

This instruction calculates the dot product of four signed 8-bit integer values held in each 32-bit element of the two or four first source vectors and four unsigned 8-bit integer values in the corresponding 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

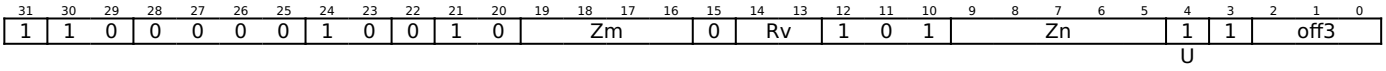
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

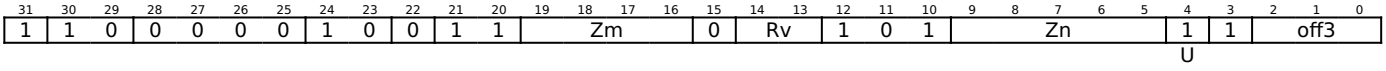
```
SUDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
SUDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn".
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" plus 1 modulo 32.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" plus 3 modulo 32.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}((n+r) MOD 32);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        var sum : bits(esize) = operand3[e*:esize];
        for i = 0 to 3 do
            let element1 : integer = SInt(operand1[(4 * e + i)*:(esize DIV 4)]);
            let element2 : integer = UInt(operand2[(4 * e + i)*:(esize DIV 4)]);
            sum = sum + element1 * element2;
        end;
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SUMLALL (multiple and indexed vector)

Multi-vector signed by unsigned 8-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each signed 8-bit element in the one, two, or four first source vectors by each unsigned 8-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The element index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

(FEAT_SME2)

Encoding

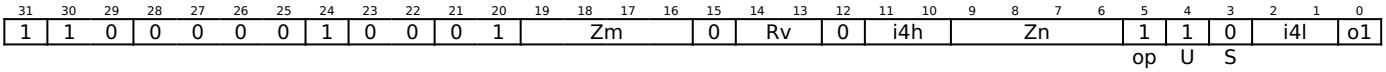
```
SUMLALL ZA.S[<Wv>, <offs1>:<offs4>], <Zn>.B, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'00');
let index : integer = UInt(i4h::i4l);
let nreg : integer{} = 1;
```

Two ZA quad-vectors

(FEAT_SME2)



Encoding

```
SUMLALL ZA.S[<Wv>, <offs1>:<offs4>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;

let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(o1::'00');
let index : integer = UInt(i4h::i4l);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	For the "One ZA quad-vector" variant: is the first vector select offset, encoded as "off2" field times 4. For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the first vector select offset, encoded as "o1" field times 4.
<offs4>	For the "One ZA quad-vector" variant: is the fourth vector select offset, encoded as "off2" field times 4 plus 3. For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the fourth vector select offset, encoded as "o1" field times 4 plus 3.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the element index, in the range 0 to 15, encoded in the "i4h:i4l" fields.
<Zn1>	For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;

SUMOP4A

Signed by unsigned integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile signed by unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

SUMOP4S

Signed by unsigned integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile signed by unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

SUMOPA (4-way)

Signed by unsigned integer sum of outer products, accumulating

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of signed 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of unsigned 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of signed 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

SUNPK

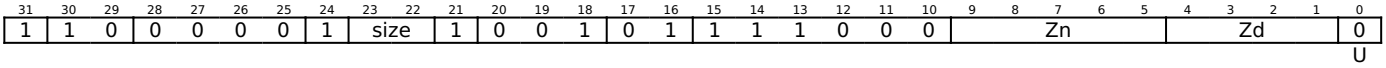
Unpack and sign-extend multi-vector elements

This instruction unpacks and sign-extends elements from one or two source vectors, and writes the sign-extended values into the double-width elements of two or four destination vectors. This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

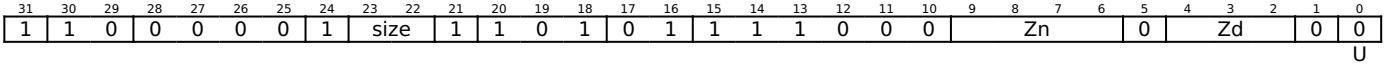
```
SUNPK { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
let unsigned : boolean = FALSE;
```

Four registers

(FEAT_SME2)



Encoding

```
SUNPK { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<Tb>-<Zn2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
let unsigned : boolean = FALSE;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let hsize : integer{} = esize DIV 2;
let sreg : integer = nreg DIV 2;
var results : array [[4]] of bits(VL);

for r = 0 to sreg-1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for i = 0 to 1 do
        for e = 0 to elements-1 do
            let element : bits(hsize) = operand[(i*elements + e)*:hsize];
            results[[2*r+i]][e*:esize] = Extend{esize}(element, unsigned);
        end;
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SUTMOPA

Signed by unsigned 8-bit integer sparse sum of outer products to 32-bit integer, accumulating

This instruction generates signed by unsigned integer sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected two sets of 2-in-4 8-bit signed values from each overlapping 32-bit containers of the two $SVL_S \times 4$ sub-matrices in the first source vectors by the four 8-bit unsigned values from the corresponding 32-bit container of the $4 \times SVL_S$ sub-matrix in the second source vector. The four selected elements from the overlapping 32-bit containers of the first source vectors correspond to two sets of 2-in-4 elements of rows of two $SVL_S \times 4$ sub-matrices. Each 32-bit container of the second source vector holds 4 elements of columns of a compressed $4 \times SVL_S$ sub-matrix.

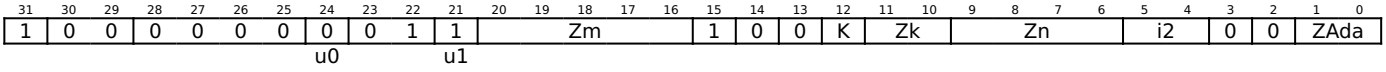
The two sets of 2-in-4 8-bit signed values from overlapping 32-bit containers of the first source vectors are selected by pairs of 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to each 32-bit container of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

This instruction is unpredicated.

SME2

(FEAT_SME_TMOP)



Encoding

```
SUTMOPA <ZAda>.S, { <Zn1>.B-<Zn2>.B }, <Zm>.B, <Zk>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_TMOP) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm);
let k : integer = UInt('1'::K::'1'::Zk);
let index : integer = UInt(i2);
let da : integer = UInt(ZAda);
let op1_unsigned : boolean = FALSE;
let op2_unsigned : boolean = TRUE;
```

Assembler Symbols

<ZAda>	Is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the control vector register Z20-Z23 or Z28-Z31, encoded as "'1':K:'1':Zk".
<index>	Is the control segment index, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let dim : integer{} = VL DIV 32;

SUVDOT

Multi-vector signed by unsigned 8-bit integer vertical dot product by indexed element to 32-bit integer

This instruction calculates the vertical dot product of the corresponding signed 8-bit elements from the four first source vectors and four unsigned 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

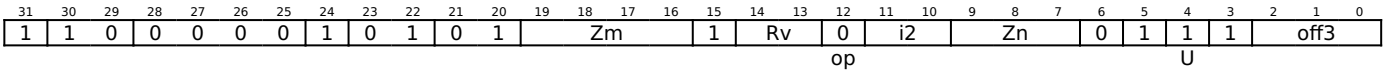
The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SUVDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV 4;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
let operand2 : bits(VL) = Z{VL}(m);
var result : bits(VL);

for r = 0 to 3 do
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        var sum : bits(esize) = operand3[e*:esize];
        for i = 0 to 3 do
            let operand1 : bits(VL) = Z{VL}(n+i);
            let element1 : integer = SInt(operand1[(4 * e + r)*:(esize DIV 4)]);
            let element2 : integer = UInt(operand2[(4 * s + i)*:(esize DIV 4)]);
            sum = sum + element1 * element2;
        end;
        result[e*:esize] = sum;
    end;

SVDOT (2-way)

Multi-vector signed 16-bit integer vertical dot product by indexed element to 32-bit integer

This instruction calculates the vertical dot product of the corresponding two signed 16-bit integer values held in the two first source vectors and two signed 16-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

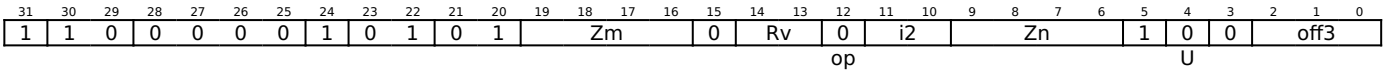
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

The vector group symbol VGx2 indicates that the ZA operand consists of two ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SVDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.

SVDOT (4-way)

Multi-vector signed integer vertical dot product by indexed element

This instruction calculates the vertical dot product of the corresponding four signed 8-bit or 16-bit integer values held in the four first source vectors and four signed 8-bit or 16-bit integer values in the corresponding indexed 32-bit or 64-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit or 64-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

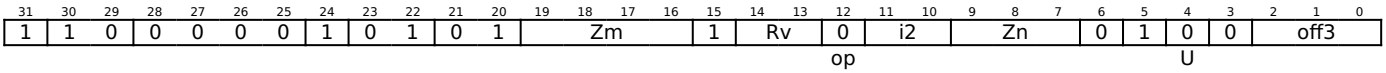
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 8-bit to 32-bit and 16-bit to 64-bit

8-bit to 32-bit

(FEAT_SME2)



Encoding

```
SVDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
```

UCLAMP

Multi-vector unsigned clamp to minimum/maximum

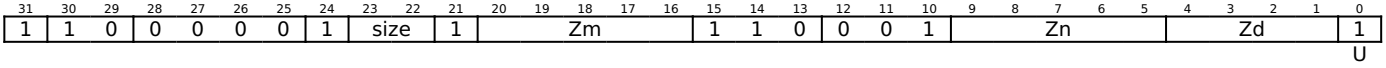
This instruction clamps each unsigned element in the two or four destination vectors to between the unsigned minimum value in the corresponding element of the first source vector and the unsigned maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the two or four destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

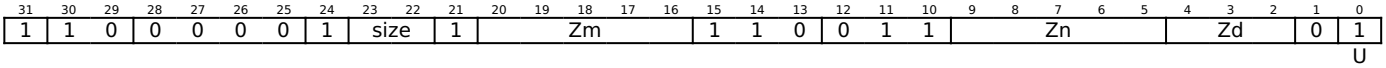
```
UCLAMP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
UCLAMP { <Zd1>.<T>-<Zd4>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;

UCVTF

Multi-vector unsigned 32-bit integer convert to single-precision

This instruction converts each element of the two or four source vectors from unsigned 32-bit integer to single-precision, and places the results in the corresponding elements of the two or four destination vectors.

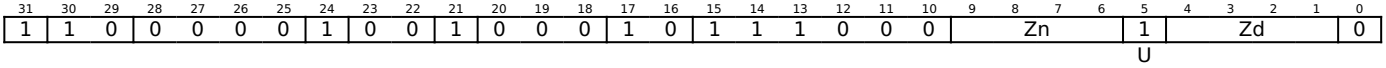
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

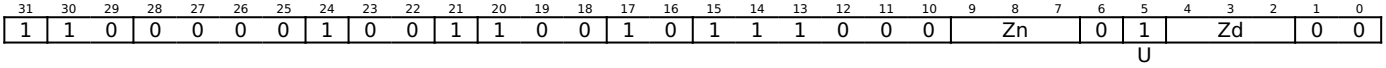
```
UCVTF { <Zd1>.S-<Zd2>.S }, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
let unsigned : boolean = TRUE;
let rounding : FPRounding = FPRoundingMode(FPCR());
```

Four registers

(FEAT_SME2)



Encoding

```
UCVTF { <Zd1>.S-<Zd4>.S }, { <Zn1>.S-<Zn4>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
let unsigned : boolean = TRUE;
let rounding : FPRounding = FPRoundingMode(FPCR());
```

Assembler Symbols

<Zd1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn1>	For the "Two registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Zn4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : bits(32) = operand[e*:32];
        results[[r]][e*:32] = FixedToFP{32, 32}(element, 0, unsigned, FPCR(), rounding);
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

UDOT (2-way, multiple and indexed vector)

Multi-vector unsigned 16-bit integer dot product by indexed element to 32-bit integer

This instruction calculates the dot product of two unsigned 16-bit integer values held in each 32-bit element of the two or four first source vectors and two unsigned 16-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

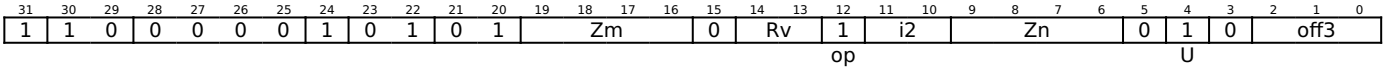
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

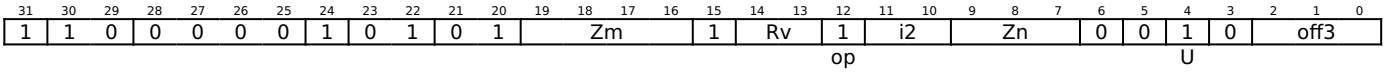
```
UDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
UDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

UDOT (4-way, multiple and single vector)

Multi-vector unsigned integer dot product by vector

This instruction calculates the dot product of four unsigned 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the two or four first source vectors and four unsigned 8-bit or 16-bit integer values in the corresponding 32-bit or 64-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit or 64-bit element of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

UMAX (multiple and single vector)

Multi-vector unsigned maximum by vector

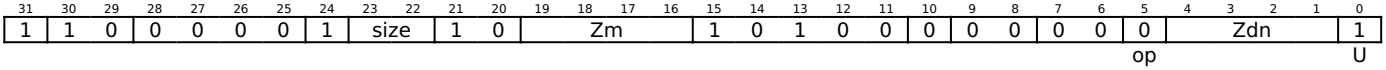
This instruction determines the unsigned maximum of elements of the second source vector and the corresponding elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

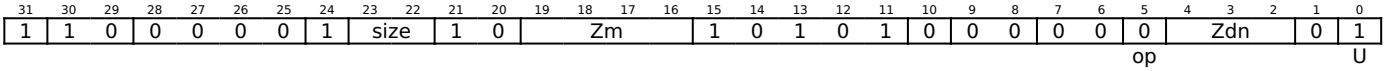
```
UMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
let unsigned : boolean = TRUE;
```

Four registers

(FEAT_SME2)



Encoding

```
UMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let op1elt : bits(esize) = operand1[e*:esize];
        let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
        let op2elt : bits(esize) = operand2[e*:esize];
        let element2 : integer = if unsigned then UInt(op2elt) else SInt(op2elt);
        let res : integer = Max(element1, element2);
        results[[r]][e*:esize] = res[esize-1:0];
    end;
end;

UMIN (multiple vectors)

Multi-vector unsigned minimum

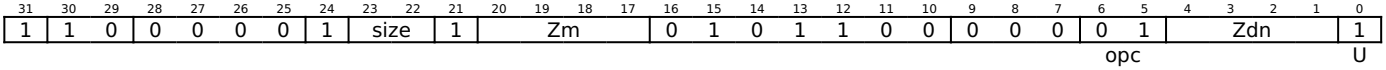
This instruction determines the unsigned minimum of elements of the two or four second source vectors and the corresponding elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

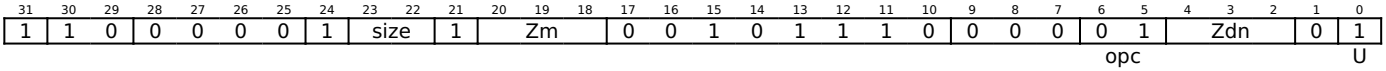
```
UMIN { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
let unsigned : boolean = TRUE;
```

Four registers

(FEAT_SME2)



Encoding

```
UMIN { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm1> For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do

UMLAL (multiple and indexed vector)

Multi-vector unsigned 16-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each unsigned 16-bit element in the one, two, or four first source vectors by each unsigned 16-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA double-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

UMLALL (multiple and indexed vector)

Multi-vector unsigned integer multiply-add long long by indexed element

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors by each unsigned 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively adds these values to the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

UMLALL (multiple and single vector)

Multi-vector unsigned integer multiply-add long long by vector

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors by each unsigned 8-bit or 16-bit element in the second source vector, widens each product to 32 bits or 64 bits, and destructively adds these values to the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

UMLSL (multiple and indexed vector)

Multi-vector unsigned 16-bit integer multiply-subtract by indexed element from 32-bit integer

This instruction multiplies each unsigned 16-bit element in the one, two, or four first source vectors by each unsigned 16-bit indexed element of the second source vector, widens each product to 32 bits, and destructively subtracts these values from the corresponding 32-bit elements of the ZA double-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

UMLSL (multiple vectors)

Multi-vector unsigned 16-bit integer multiply-subtract from 32-bit integer

This instruction multiplies each unsigned 16-bit element in the two or four first source vectors by each unsigned 16-bit element in the two or four second source vectors, widens each product to 32 bits, and destructively subtracts these values from the corresponding 32-bit elements of the ZA double-vector groups.

The double-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo half or quarter the number of ZA array vectors.

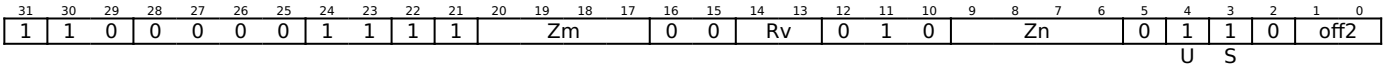
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA double-vectors and Four ZA double-vectors

Two ZA double-vectors

(FEAT_SME2)



Encoding

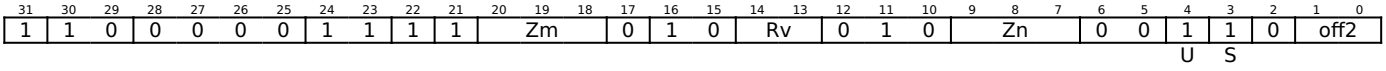
```
UMLSL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 2;
```

Four ZA double-vectors

(FEAT_SME2)



Encoding

```
UMLSL ZA.S[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	Is the first vector select offset, encoded as "off2" field times 2.
<offs2>	Is the second vector select offset, encoded as "off2" field times 2 plus 1.
<Zn1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();

UMLSLL (multiple and indexed vector)

Multi-vector unsigned integer multiply-subtract long long by indexed element

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors by each unsigned 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively subtracts these values from the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

UMOP4A (2-way)

Unsigned 16-bit integer quarter-tile sum of outer products to 32-bit integer, accumulating

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.
Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors.
Each 32-bit container of the half-vectors in the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products are then destructively added to the 32-bit integer destination tile.
This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

UMOP4A (4-way)

Unsigned integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.

UMOP4S (4-way)

Unsigned integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

UMOPA (2-way)

Unsigned 16-bit integer sum of outer products to 32-bit integer, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. The first source holds $SVL_S \times 2$ sub-matrix of unsigned 16-bit integer values, and the second source holds $2 \times SVL_S$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix, and each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

UMOPA (4-way)

Unsigned integer sum of outer products, accumulating

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of unsigned 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

UMOPS (2-way)

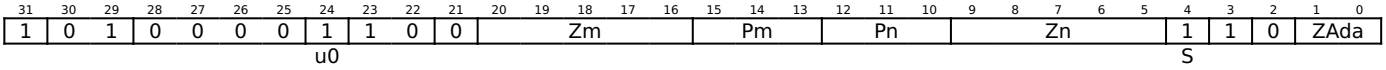
Unsigned 16-bit integer sum of outer products to 32-bit integer, subtracting

This instruction works with a 32-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. The first source holds $SVL_S \times 2$ sub-matrix of unsigned 16-bit integer values, and the second source holds $2 \times SVL_S$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively subtracted from the 32-bit integer destination tile.
This is equivalent to performing a 2-way dot product and subtract from each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix, and each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

SME2

(FEAT_SME2)



Encoding

```
UMOPS <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.H, <Zm>.H
```

UMOPS (4-way)

Unsigned integer sum of outer products, subtracting

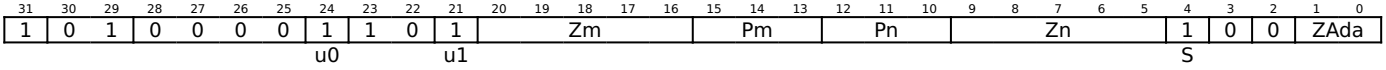
The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of unsigned 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively subtracted from the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SME)



Encoding

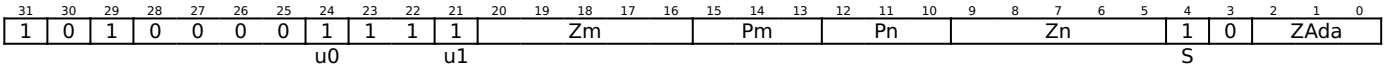
```
UMOPS <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(ZAda);
let op1_unsigned : boolean = TRUE;
let op2_unsigned : boolean = TRUE;
```

64-bit

(FEAT_SME_I16I64)



Encoding

```
UMOPS <ZAda>.D, <Pn>/M, <Pm>/M, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_I16I64) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let a : integer = UInt(Pn);

UQCVT (four registers)

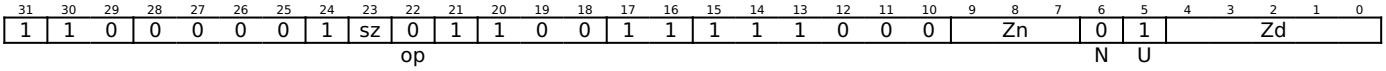
Multi-vector unsigned saturating extract narrow

This instruction saturates the unsigned integer value in each element of the four source vectors to quarter the original source element width, and places the results in the quarter-width destination elements.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
UQCVT <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(sz);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	B
1	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	S
1	D

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (4 * esize);
var result : bits(VL);

for r = 0 to 3 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : integer = UInt(operand[e*:(4 * esize)]);
        result[(r*elements + e)*:esize] = UnsignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

UQCVT (two registers)

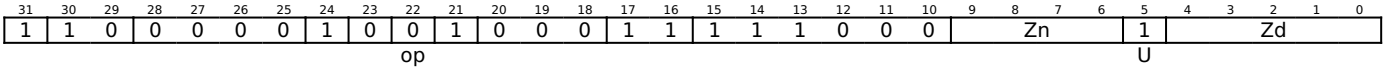
Multi-vector unsigned 32-bit integer saturating extract narrow to 16-bit integer

This instruction saturates the unsigned 32-bit integer value in each element of the two source vectors to half the original source element width, and places the 16-bit results in the half-width destination elements.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
UQCVT <Zd>.H, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for r = 0 to 1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : integer = UInt(operand[e*:(2 * esize)]);
        result[(r*elements + e)*:esize] = UnsignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

URSHL (multiple and single vector)

Multi-vector unsigned rounding shift left by vector

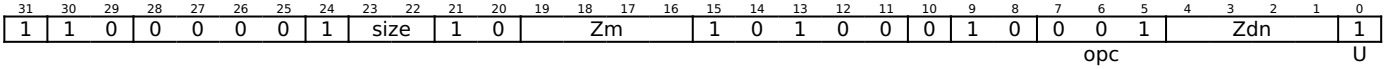
This instruction shifts the unsigned elements of the two or four first source vectors by the corresponding elements of the second source vector, and destructively places the rounded results in the corresponding elements of the two or four first source vectors. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

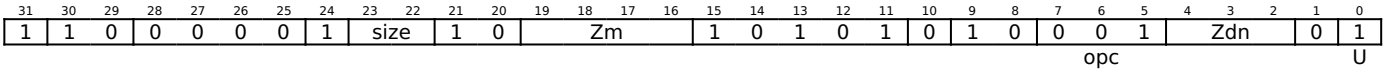
```
URSHL { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
URSHL { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let element : integer = UInt(operand1[e*:esize]);
        var shift : integer = ShiftSat(SInt(operand2[e*:esize]), esize);
        var res : integer;
        if shift >= 0 then
            res = element << shift;
        else
            shift = -shift;
            res = (element + 1 << (shift - 1)) >> shift;
        end;
        results[[r]][e*:esize] = res[esize-1:0];
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

URSHL (multiple vectors)

Multi-vector unsigned rounding shift left

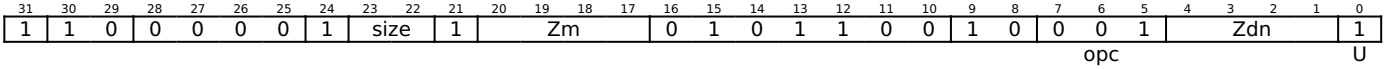
This instruction shifts the unsigned elements of the two or four first source vectors by the corresponding elements of the two or four second source vectors, and destructively places the rounded results in the corresponding elements of the two or four first source vectors. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

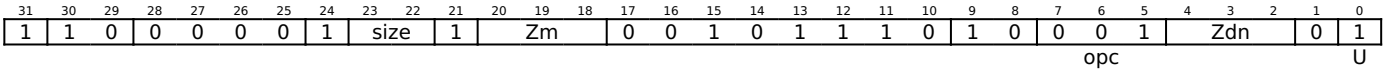
```
URSHL { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
URSHL { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm1> For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element : integer = UInt(operand1[e*:esize]);
        var shift : integer = ShiftSat(SInt(operand2[e*:esize]), esize);
        var res : integer;
        if shift >= 0 then
            res = element << shift;
        else
            shift = -shift;
            res = (element + 1 << (shift - 1)) >> shift;
        end;
        results[[r]][e*:esize] = res[esize-1:0];
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

USDOT (4-way, multiple and indexed vector)

Multi-vector unsigned by signed 8-bit integer dot product by indexed element to 32-bit integer

This instruction calculates the dot product of four unsigned 8-bit integer values held in each 32-bit element of the two or four first source vectors and four signed 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

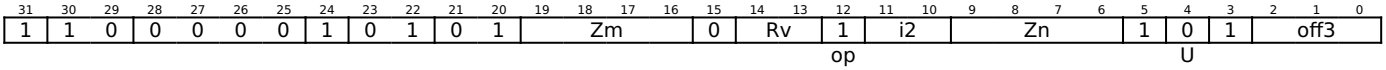
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

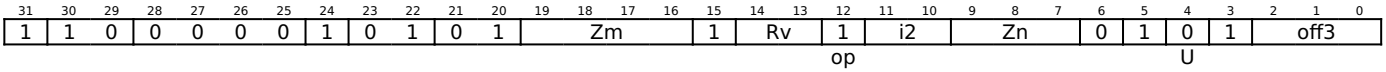
```
USDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
USDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        var sum : bits(esize) = operand3[e*:esize];
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        for i = 0 to 3 do
            let element1 : integer = UInt(operand1[(4 * e + i)*:(esize DIV 4)]);
            let element2 : integer = SInt(operand2[(4 * s + i)*:(esize DIV 4)]);
            sum = sum + element1 * element2;
        end;
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

USMLALL (multiple and indexed vector)

Multi-vector unsigned by signed 8-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each unsigned 8-bit element in the one, two, or four first source vectors by each signed 8-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The element index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	For the "One ZA quad-vector" variant: is the first vector select offset, encoded as "off2" field times 4. For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the first vector select offset, encoded as "o1" field times 4.
<offs4>	For the "One ZA quad-vector" variant: is the fourth vector select offset, encoded as "off2" field times 4 plus 3. For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the fourth vector select offset, encoded as "o1" field times 4 plus 3.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the element index, in the range 0 to 15, encoded in the "i4h:i4l" fields.
<Zn1>	For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);
vec = vec - vec MOD 4;

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for i = 0 to 3 do
        let operand3 : bits(VL) = ZAvector{VL}(vec+i);
        for e = 0 to elements-1 do
            let segmentbase : integer = e - e MOD eltspersegment;
            let s : integer = 4 * segmentbase + index;
            let element1 : integer = UInt(operand1[(4*e+i)*:(esize DIV 4)]);
            let element2 : integer = SInt(operand2[s*:(esize DIV 4)]);
            let product : bits(esize) = (element1 * element2)[esize-1:0];
            result[e*:esize] = operand3[e*:esize] + product;
        end;
        ZAvector{VL}(vec+i) = result;
    end;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

USMLALL (multiple and single vector)

Multi-vector unsigned by signed 8-bit integer multiply-add by vector to 32-bit integer

This instruction multiplies each unsigned 8-bit element in the one, two, or four first source vectors by each signed 8-bit element in the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA quad-vector groups.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

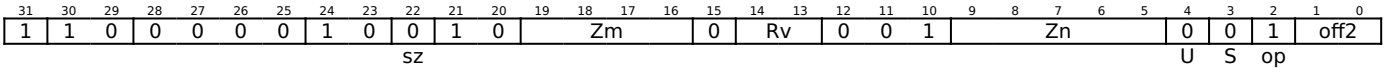
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

(FEAT_SME2)



Encoding

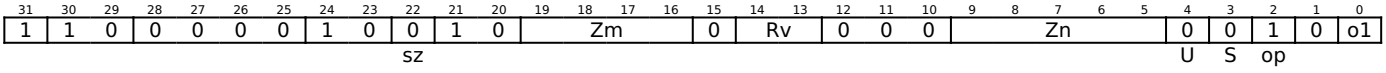
```
USMLALL ZA.S[<Wv>, <offs1>:<offs4>], <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'00');
let nreg : integer{} = 1;
```

Two ZA quad-vectors

(FEAT_SME2)



Encoding

```
USMLALL ZA.S[<Wv>, <offs1>:<offs4>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);

USMOP4A

Unsigned by signed integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile unsigned by signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

USMOP4S

Unsigned by signed integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile unsigned by signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

USMOPA (4-way)

Unsigned by signed integer sum of outer products, accumulating

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

USTMOPA

Unsigned by signed 8-bit integer sparse sum of outer products to 32-bit integer, accumulating

This instruction generates unsigned by signed integer sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected two sets of 2-in-4 8-bit unsigned values from each overlapping 32-bit containers of the two $SVL_S \times 4$ sub-matrices in the first source vectors by the four 8-bit signed values from the corresponding 32-bit container of the $4 \times SVL_S$ sub-matrix in the second source vector. The four selected elements from the overlapping 32-bit containers of the first source vectors correspond to two sets of 2-in-4 elements of rows of two $SVL_S \times 4$ sub-matrices. Each 32-bit container of the second source vector holds 4 elements of columns of a compressed $4 \times SVL_S$ sub-matrix.

The two sets of 2-in-4 8-bit unsigned values from overlapping 32-bit containers of the first source vectors are selected by pairs of 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to each 32-bit container of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

This instruction is unpredicated.

USVDOT

Multi-vector unsigned by signed 8-bit integer vertical dot product by indexed element to 32-bit integer

This instruction calculates the vertical dot product of corresponding unsigned 8-bit elements from the four first source vectors and four signed 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

UUNPK

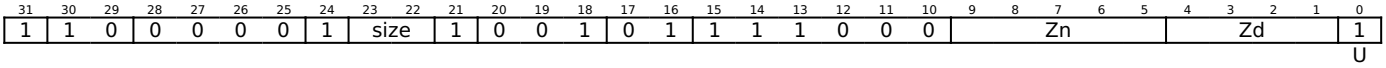
Unpack and zero-extend multi-vector elements

This instruction unpacks and zero-extends elements from one or two source vectors, and writes the zero-extended values into double width elements of the two or four destination vectors. This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

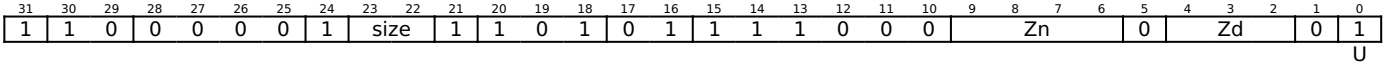
```
UUNPK { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
let unsigned : boolean = TRUE;
```

Four registers

(FEAT_SME2)



Encoding

```
UUNPK { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<Tb>-<Zn2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let hsize : integer{} = esize DIV 2;
let sreg : integer = nreg DIV 2;
var results : array [[4]] of bits(VL);

for r = 0 to sreg-1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for i = 0 to 1 do
        for e = 0 to elements-1 do
            let element : bits(hsize) = operand[(i*elements + e)*:hsize];
            results[[2*r+i]][e*:esize] = Extend{esize}(element, unsigned);
        end;
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UVDOT (2-way)

Multi-vector unsigned 16-bit integer vertical dot product by indexed element to 32-bit integer

This instruction calculates the vertical dot product of the corresponding two unsigned 16-bit integer values held in the two first source vectors and two unsigned 16-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

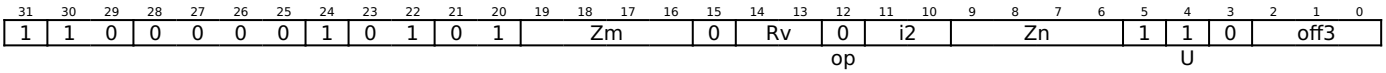
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

The vector group symbol VGx2 indicates that the ZA operand consists of two ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
UVDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV 2;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
let operand2 : bits(VL) = Z{VL}(m);
var result : bits(VL);

for r = 0 to 1 do
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        var sum : bits(esize) = operand3[e*:esize];
        for i = 0 to 1 do
            let operand1 : bits(VL) = Z{VL}(n+i);
            let element1 : integer = UInt(operand1[(2 * e + r)*:(esize DIV 2)]);
            let element2 : integer = UInt(operand2[(2 * s + i)*:(esize DIV 2)]);
            sum = sum + element1 * element2;
        end;
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UVDOT (4-way)

Multi-vector unsigned integer vertical dot product by indexed element

This instruction calculates the vertical dot product of the corresponding four unsigned 8-bit or 16-bit integer values held in the four first source vectors and four unsigned 8-bit or 16-bit integer values in the corresponding indexed 32-bit or 64-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit or 64-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

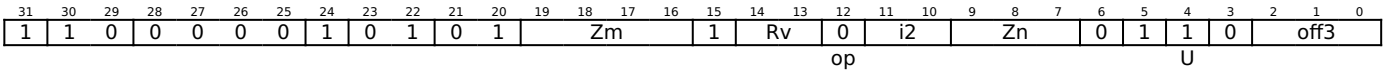
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 8-bit to 32-bit and 16-bit to 64-bit

8-bit to 32-bit

(FEAT_SME2)



Encoding

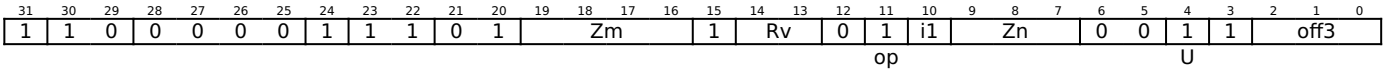
```
UVDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
```

16-bit to 64-bit

(FEAT_SME2 && FEAT_SME_I16I64)



Encoding

```
UVDOT ZA.D[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !(IsFeatureImplemented(FEAT_SME2) && IsFeatureImplemented(FEAT_SME_I16I64)) then
    EndOfDecode(Decode_UNDEF);
end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 64;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i1);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	For the "8-bit to 32-bit" variant: is the immediate index of a group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field. For the "16-bit to 64-bit" variant: is the immediate index of a group of four 16-bit values within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV 4;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
let operand2 : bits(VL) = Z{VL}(m);
var result : bits(VL);

for r = 0 to 3 do
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        var sum : bits(esize) = operand3[e*:esize];
        for i = 0 to 3 do
            let operand1 : bits(VL) = Z{VL}(n+i);
            let element1 : integer = UInt(operand1[(4 * e + r)*:(esize DIV 4)]);
            let element2 : integer = UInt(operand2[(4 * s + i)*:(esize DIV 4)]);
            sum = sum + element1 * element2;
        end;
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

UZP (four registers)

Concatenate elements from four vectors

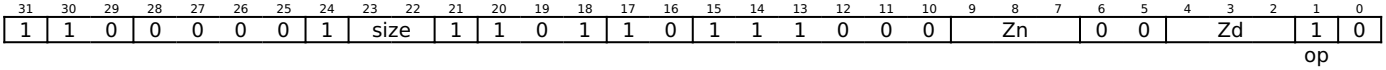
This instruction concatenates every fourth element from each of the four source vectors and places them in the corresponding elements of the four destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

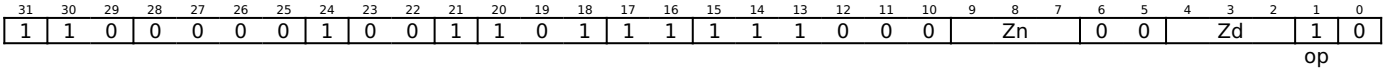
```
UZP { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<T>-<Zn4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '11' && MaxImplementedSVL() < 256 then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
```

128-bit element

(FEAT_SME2)



Encoding

```
UZP { <Zd1>.Q-<Zd4>.Q }, { <Zn1>.Q-<Zn4>.Q }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < esize * 4 then EndOfDecode(Decode_UNDEF); end;
let quads : integer = VL DIV (esize * 4);

var result0 : bits(VL);
var result1 : bits(VL);
var result2 : bits(VL);
var result3 : bits(VL);

for r = 0 to 3 do
    let operand : bits(VL) = Z{VL}(n+r);
    let base : integer = r * quads;
    for q = 0 to quads-1 do
        result0[(base+q)*:esize] = operand[(4*q+0)*:esize];
        result1[(base+q)*:esize] = operand[(4*q+1)*:esize];
        result2[(base+q)*:esize] = operand[(4*q+2)*:esize];
        result3[(base+q)*:esize] = operand[(4*q+3)*:esize];
    end;
end;

Z{VL}(d+0) = result0;
Z{VL}(d+1) = result1;
Z{VL}(d+2) = result2;
Z{VL}(d+3) = result3;
```

UZP (two registers)

Concatenate elements from two vectors

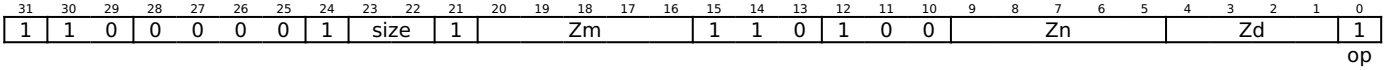
This instruction concatenates every second element from each of the first and second source vectors and places them in the corresponding elements of the two destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

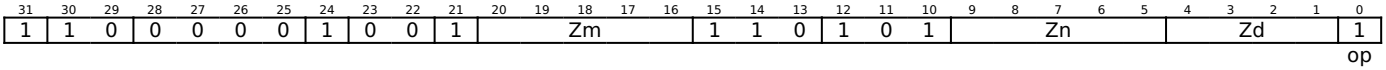
```
UZP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
```

128-bit element

(FEAT_SME2)



Encoding

```
UZP { <Zd1>.Q-<Zd2>.Q }, <Zn>.Q, <Zm>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < esize * 2 then EndOfDecode(Decode_UNDEF); end;
let pairs : integer = VL DIV (esize * 2);

var result0 : bits(VL);
var result1 : bits(VL);

for r = 0 to 1 do
    let base : integer = r * pairs;
    let operand : bits(VL) = if r == 0 then Z{VL}(n) else Z{VL}(m);
    for p = 0 to pairs-1 do
        result0[(base+p)*:esize] = operand[(2*p+0)*:esize];
        result1[(base+p)*:esize] = operand[(2*p+1)*:esize];
    end;
end;

Z{VL}(d+0) = result0;
Z{VL}(d+1) = result1;
```

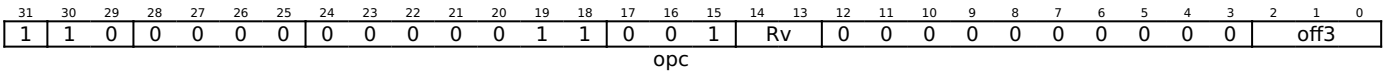
ZERO (double-vector)

Zero ZA double-vector groups

This instruction zeroes one, two, or four ZA double-vector groups.
The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively.
It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2p1)



Encoding

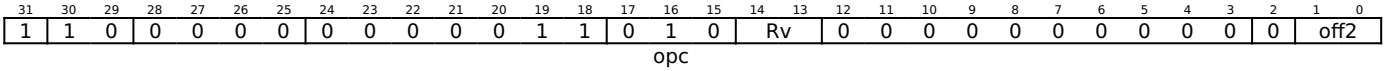
```
ZERO ZA.D[<Wv>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3::'0');
let ngrp : integer = 1;
let nvec : integer = 2;
```

Two ZA double-vectors

(FEAT_SME2p1)



Encoding

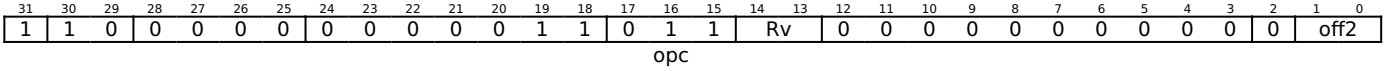
```
ZERO ZA.D[<Wv>, <offs1>:<offs2>, VGx2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off2::'0');
let ngrp : integer = 2;
let nvec : integer = 2;
```

Four ZA double-vectors

(FEAT_SME2p1)



Encoding

```
ZERO ZA.D[<Wv>, <offs1>:<offs2>, VGx4]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off2::'0');
let ngrp : integer = 4;
let nvec : integer = 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	For the "One ZA double-vector" variant: is the first vector select offset, encoded as "off3" field times 2. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the first vector select offset, encoded as "off2" field times 2.
<offs2>	For the "One ZA double-vector" variant: is the second vector select offset, encoded as "off3" field times 2 plus 1.

For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the second vector select offset, encoded as "off2" field times 2 plus 1.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV ngrp;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
vec = vec - vec MOD nvec;
for r = 0 to ngrp-1 do
    for i = 0 to nvec-1 do
        ZAvector{VL}(vec + i) = Zeros{VL};
    end;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

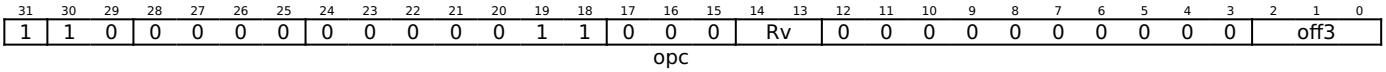
ZERO (single-vector)

Zero ZA single-vector groups

This instruction zeroes two or four ZA single-vector groups.
The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively.
It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2p1)



Encoding

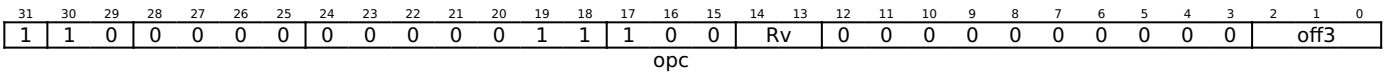
```
ZERO ZA.D[<Wv>, <offs>, VGx2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let ngrp : integer = 2;
```

Four ZA single-vectors

(FEAT_SME2p1)



Encoding

```
ZERO ZA.D[<Wv>, <offs>, VGx4]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let ngrp : integer = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV ngrp;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to ngrp-1 do
    ZAvector{VL}(vec) = Zeros{VL};
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

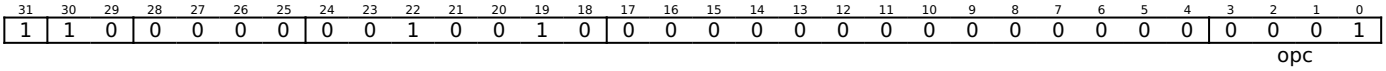
ZERO (table)

Zero ZT0

This instruction zeroes all bytes of the ZT0 register.
This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME2

(FEAT_SME2)



Encoding

```
ZERO { ZT0 }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
```

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();
ZT0{512}() = Zeros{512};
```

ZERO (tiles)

Zero a list of 64-bit element ZA tiles

This instruction zeroes all bytes within each of the up to eight listed 64-bit element tiles named ZA0.D to ZA7.D, leaving the other 64-bit element tiles unmodified.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

For programmer convenience, an assembler must also accept the names of 32-bit, 16-bit, and 8-bit element tiles that are converted into the corresponding set of 64-bit element tiles.

In accordance with the architecturally defined mapping between different element size tiles:

- Zeroing the 8-bit element tile name ZA0.B, or the entire array name ZA, is equivalent to zeroing all eight 64-bit element tiles named ZA0.D to ZA7.D.
- Zeroing the 16-bit element tile name ZA0.H is equivalent to zeroing 64-bit element tiles named ZA0.D, ZA2.D, ZA4.D, and ZA6.D.
- Zeroing the 16-bit element tile name ZA1.H is equivalent to zeroing 64-bit element tiles named ZA1.D, ZA3.D, ZA5.D, and ZA7.D.
- Zeroing the 32-bit element tile name ZA0.S is equivalent to zeroing 64-bit element tiles named ZA0.D and ZA4.D.
- Zeroing the 32-bit element tile name ZA1.S is equivalent to zeroing 64-bit element tiles named ZA1.D and ZA5.D.
- Zeroing the 32-bit element tile name ZA2.S is equivalent to zeroing 64-bit element tiles named ZA2.D and ZA6.D.
- Zeroing the 32-bit element tile name ZA3.S is equivalent to zeroing 64-bit element tiles named ZA3.D and ZA7.D.

The preferred disassembly of this instruction uses the shortest list of tile names that represent the encoded immediate mask.

For example:

- An immediate that encodes 64-bit element tiles ZA0.D, ZA1.D, ZA4.D, and ZA5.D is disassembled as {ZA0.S, ZA1.S}.
- An immediate that encodes 64-bit element tiles ZA0.D, ZA2.D, ZA4.D, and ZA6.D is disassembled as {ZA0.H}.
- An all-ones immediate is disassembled as {ZA}.
- An all-zeros immediate is disassembled as an empty list { }.

SME

(FEAT_SME)

Encoding

```
ZERO { {<mask>} }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let mask : bits(8) = imm8;
let esize : integer{} = 64;
```

Assembler Symbols

<mask>	Is the optional list of up to eight 64-bit element tile names separated by commas, encoded in the "imm8" field.

Operation

```
CheckSMEAndZAEnabled();
let SVL : integer{} = CurrentSVL();
let dim : integer{} = SVL DIV esize;
let result : bits(dim*dim*esize) = Zeros{};

for i = 0 to 7 do
    if mask[i] == '1' then ZAtile{dim*dim*esize}(i, esize) = result; end;
end;
```

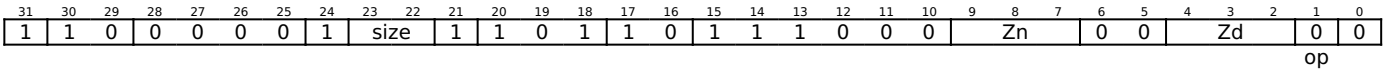
ZIP (four registers)

Interleave elements from four vectors

This instruction places the four-way interleaved elements from the four source vectors in the corresponding elements of the four destination vectors. This instruction is unpredicated.
It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

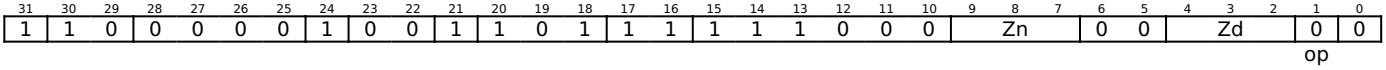
```
ZIP { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<T>-<Zn4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '11' && MaxImplementedSVL() < 256 then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
```

128-bit element

(FEAT_SME2)



Encoding

```
ZIP { <Zd1>.Q-<Zd4>.Q }, { <Zn1>.Q-<Zn4>.Q }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < esize * 4 then EndOfDecode(Decode_UNDEF); end;
let quads : integer = VL DIV (esize * 4);

let operand0 : bits(VL) = Z{VL}(n);
let operand1 : bits(VL) = Z{VL}(n+1);
let operand2 : bits(VL) = Z{VL}(n+2);
let operand3 : bits(VL) = Z{VL}(n+3);
var result : bits(VL);

for r = 0 to 3 do
    let base : integer = r * quads;
    for q = 0 to quads-1 do
        result[(4*q+0)*:esize] = operand0[(base+q)*:esize];
        result[(4*q+1)*:esize] = operand1[(base+q)*:esize];
        result[(4*q+2)*:esize] = operand2[(base+q)*:esize];
        result[(4*q+3)*:esize] = operand3[(base+q)*:esize];
    end;
    Z{VL}(d+r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ZIP (two registers)

Interleave elements from two vectors

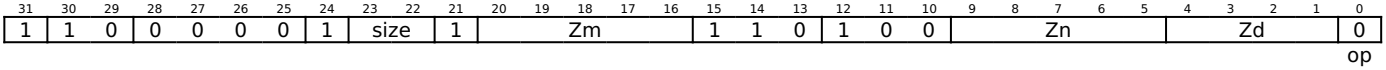
This instruction places the two-way interleaved elements from the first and second source vectors in the corresponding elements of the two destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

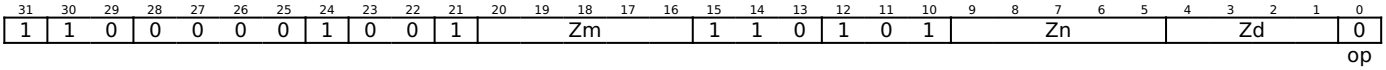
```
ZIP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
```

128-bit element

(FEAT_SME2)



Encoding

```
ZIP { <Zd1>.Q-<Zd2>.Q }, <Zn>.Q, <Zm>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < esize * 2 then EndOfDecode(Decode_UNDEF); end;
let pairs : integer = VL DIV (esize * 2);

let operand0 : bits(VL) = Z{VL}(n);
let operand1 : bits(VL) = Z{VL}(m);
var result : bits(VL);

for r = 0 to 1 do
    let base : integer = r * pairs;
    for p = 0 to pairs-1 do
        result[(2*p+0)*:esize] = operand0[(base+p)*:esize];
        result[(2*p+1)*:esize] = operand1[(base+p)*:esize];
    end;
    Z{VL}(d+r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SME2 Sparse Outer Product

The encodings in this section are decoded from SME encodings.

Decode fields						Instruction details	Condition
op0	op1	op2	op3	op4	op5		
0	0	0	0	0		FTMOPA (non-widening) — Single-precision	FEAT_SME_TMOP
0	0	0	0	1	0	UNALLOCATED	-
0	1	0	0	0		FTMOPA (widening, 4-way)	FEAT_SME_TMOP && FEAT_SME_F8F32
0	1	0	0	1	0	FTMOPA (widening, 2-way, FP8 to FP16)	FEAT_SME_TMOP && FEAT_SME_F8F16
1	0	0	0	0		BFTMOPA (widening)	FEAT_SME_TMOP
1	0	0	0	1	0	FTMOPA (non-widening) — Half-precision	FEAT_SME_TMOP && FEAT_SME_F16F16
1	1	0	0	0		FTMOPA (widening, 2-way, FP16 to FP32)	FEAT_SME_TMOP
1	1	0	0	1	0	BFTMOPA (non-widening)	FEAT_SME_TMOP && FEAT_SME_B16B16
	0	1	0	1		SME2 Int16 to Int32 sparse outer product	-
	1	1	0	1		UNALLOCATED	-
		0	0	1	1	UNALLOCATED	-
		1	0	0		SME Int8 to Int32 sparse outer product	-
			1			UNALLOCATED	-

SME2 Int16 to Int32 sparse outer product

The encodings in this section are decoded from SME2 Sparse Outer Product.

Decode fields	Instruction Details	Condition
u0		
0	STMOPA (2-way)	FEAT_SME_TMOP
1	UTMOPA (2-way)	FEAT_SME_TMOP

SME Int8 to Int32 sparse outer product

The encodings in this section are decoded from SME2 Sparse Outer Product.

Decode fields		Instruction Details	Condition
u0	u1		
0	0	STMOPA (4-way)	FEAT_SME_TMOP
0	1	SUTMOPA	FEAT_SME_TMOP
1	0	USTMOPA	FEAT_SME_TMOP
1	1	UTMOPA (4-way)	FEAT_SME_TMOP

SME FP Outer Product - 32 bit

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details	Condition
op0	op1	op2		
0	0		SME FP32 outer product	-
0	1	0	FMOPA (widening, 4-way)	FEAT_SME_F8F32
0	1	1	UNALLOCATED	-
1	0		SME BFloat16 widening outer product	-
1	1		SME FP16 widening outer product	-

SME FP32 outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Condition
S		
0	FMOPA (non-widening)	FEAT_SME
1	FMOPS (non-widening)	FEAT_SME

SME BFloat16 widening outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Condition
S		
0	BFMOPA (widening)	FEAT_SME
1	BFMOPS (widening)	FEAT_SME

SME FP16 widening outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Condition
S		
0	FMOPA (widening, 2-way, FP16 to FP32)	FEAT_SME
1	FMOPS (widening)	FEAT_SME

SME2 Outer Product - Misc

The encodings in this section are decoded from SME encodings.

Decode fields				Instruction details	Condition
op0	op1	op2	op3		
0	0			SME2 32-bit binary outer product	-
0	1	0	0	FMOPA (widening, 2-way, FP8 to FP16)	FEAT_SME_F8F16
0	1	1	0	UNALLOCATED	-
0	1		1	UNALLOCATED	-
1	0		0	SME2 FP16 non-widening outer product	-
1	1		0	SME2 BFloat16 non-widening outer product	-
1			1	UNALLOCATED	-

SME2 32-bit binary outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Condition
S		
0	BMOPA	FEAT_SME2
1	BMOPS	FEAT_SME2

SME2 FP16 non-widening outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Condition
S		
0	FMOPA (non-widening)	FEAT_SME_F16F16
1	FMOPS (non-widening)	FEAT_SME_F16F16

SME2 BFloat16 non-widening outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Condition
S		
0	BFMOPA (non-widening)	FEAT_SME_B16B16
1	BFMOPS (non-widening)	FEAT_SME_B16B16

SME2 Multi-vector - Memory (Contiguous)

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details
op0	op1	op2	
00x	0		SME2 multi-vec contiguous load (scalar plus scalar, two registers)
00x	1	0	SME2 multi-vec contiguous load (scalar plus scalar, four registers)
01x	0		SME2 multi-vec contiguous store (scalar plus scalar, two registers)
01x	1	0	SME2 multi-vec contiguous store (scalar plus scalar, four registers)
100	0		SME2 multi-vec contiguous load (scalar plus immediate, two registers)
100	1	0	SME2 multi-vec contiguous load (scalar plus immediate, four registers)
110	0		SME2 multi-vec contiguous store (scalar plus immediate, two registers)
110	1	0	SME2 multi-vec contiguous store (scalar plus immediate, four registers)
1x1			UNALLOCATED
!= 1x1	1	1	UNALLOCATED

SME2 multi-vec contiguous load (scalar plus scalar, two registers)

The encodings in this section are decoded from SME2 Multi-vector - Memory (Contiguous).

Decode fields N	Instruction Details	Condition
0	FCVT (narrowing, FP32 to FP8)	FEAT_SME2 && FEAT_FP8
1	FCVTN (FP32 to FP8)	FEAT_SME2 && FEAT_FP8

SME2 multi-vec quadwords ZIP four registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields op	Instruction Details	Condition
0	ZIP (four registers)	FEAT_SME2
1	UZP (four registers)	FEAT_SME2

SME2 multi-vec FP down convert two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields op	N	Instruction Details	Condition
0	0	FCVT (narrowing, FP32 to FP16)	FEAT_SME2
0	1	FCVTN (FP32 to FP16)	FEAT_SME2
1	0	BFCVT (single-precision to BFloat16)	FEAT_SME2
1	1	BFCVTN	FEAT_SME2

SME2 multi-vec int down convert two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields op	U	Instruction Details	Condition
0	0	SQCVT (two registers)	FEAT_SME2
0	1	UQCVT (two registers)	FEAT_SME2
1	0	SQCVTU (two registers)	FEAT_SME2
1	1	UNALLOCATED	-

SME2 multi-vec FP8 down convert two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields op	Instruction Details	Condition
0	FCVT (narrowing, FP16 to FP8)	FEAT_SME2 && FEAT_FP8
1	BFCVT (BFloat16 to 8-bit floating-point)	FEAT_SME2 && FEAT_FP8

SME2 multi-vec convert two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields L	Instruction Details	Condition
0	FCVT (widening)	FEAT_SME_F16F16
1	FCVTL	FEAT_SME_F16F16

SME2 multi-vec unpack two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields U	Instruction Details	Condition
0	SUNPK	FEAT_SME2
1	UUNPK	FEAT_SME2

SME2 multi-vec FP8 up convert two registers

The encodings in this section are decoded from SME2 Multi-vector - SVE Constructive Unary.

Decode fields opc	L	Instruction Details	Condition
00	0	F1CVT, F2CVT — F1CVT	FEAT_SME2 && FEAT_FP8
00	1	F1CVTL, F2CVTL — F1CVTL	FEAT_SME2 && FEAT_FP8
01	0	BF1CVT, BF2CVT — BF1CVT	FEAT_SME2 && FEAT_FP8

SME2 Multi-vector - FP Multiply

The encodings in this section are decoded from SME encodings.

Decode fields op0	op1	op2	Instruction details
01	0	0	SME2 multi-vec FP multiply (four registers)
01	0	1	UNALLOCATED
01	1		UNALLOCATED
11			UNALLOCATED
x0			SME2 multi-vec FP multiply (two registers)

SME2 multi-vec FP multiply (four registers)

The encodings in this section are decoded from SME2 Multi-vector - FP Multiply.

Decode fields size	Instruction Details	Condition
00	BFMUL (multiple vectors)	FEAT_SME2 && FEAT_SVE_BFSCALE
!= 00	FMUL (multiple vectors)	FEAT_SME2p2

SME2 multi-vec FP multiply (two registers)

The encodings in this section are decoded from SME2 Multi-vector - FP Multiply.

Decode fields size	Instruction Details	Condition
00	BFMUL (multiple vectors)	FEAT_SME2 && FEAT_SVE_BFSCALE
!= 00	FMUL (multiple vectors)	FEAT_SME2p2

SME2 Multiple and Single Vector - FP multiply

The encodings in this section are decoded from SME encodings.

Decode fields op0	op1	op2	Instruction details
0			SME2 multiple and single vector FP multiply (two registers)
1	0	0	SME2 multiple and single vector FP multiply (four registers)
1	0	1	UNALLOCATED
1	1		UNALLOCATED

SME2 multiple and single vector FP multiply (two registers)

The encodings in this section are decoded from SME2 Multiple and Single Vector - FP multiply.

Decode fields size	Instruction Details	Condition
00	BFMUL (multiple and single vector)	FEAT_SME2 && FEAT_SVE_BFSCALE
!= 00	FMUL (multiple and single vector)	FEAT_SME2p2

SME2 multiple and single vector FP multiply (four registers)

The encodings in this section are decoded from SME2 Multiple and Single Vector - FP multiply.

Decode fields size	Instruction Details	Condition
00	BFMUL (multiple and single vector)	FEAT_SME2 && FEAT_SVE_BFSCALE
!= 00	FMUL (multiple and single vector)	FEAT_SME2p2

SME Memory

The encodings in this section are decoded from SME encodings.

Decode fields op0	op1	op2	op3	op4	Instruction details	Condition
0xx0				0xx	SME load array vector (elements)	-

SVE integer compare with signed immediate

The encodings in this section are decoded from SVE encodings.

Decode fields op	o2	ne	Instruction Details	Condition
0	0	0	CMP<cc> (immediate) — Greater than or equal	FEAT_SVE || FEAT_SME
0	0	1	CMP<cc> (immediate) — Greater than	FEAT_SVE || FEAT_SME
0	1	0	CMP<cc> (immediate) — Less than	FEAT_SVE || FEAT_SME
0	1	1	CMP<cc> (immediate) — Less than or equal	FEAT_SVE || FEAT_SME
1	0	0	CMP<cc> (immediate) — Equal	FEAT_SVE || FEAT_SME
1	0	1	CMP<cc> (immediate) — Not equal	FEAT_SVE || FEAT_SME
1	1		UNALLOCATED	-

SVE broadcast predicate element

The encodings in this section are decoded from SVE encodings.

Decode fields S	Instruction Details	Condition
0	PSEL	FEAT_SME || FEAT_SVE2p1
1	UNALLOCATED	-

SVE two-way dot product

The encodings in this section are decoded from SVE encodings.

Decode fields U	Instruction Details	Condition
0	SDOT (2-way, vectors)	FEAT_SME2 || FEAT_SVE2p1
1	UDOT (2-way, vectors)	FEAT_SME2 || FEAT_SVE2p1

SVE two-way dot product (indexed)

The encodings in this section are decoded from SVE encodings.

Decode fields U	Instruction Details	Condition
0	SDOT (2-way, indexed)	FEAT_SME2 || FEAT_SVE2p1
1	UDOT (2-way, indexed)	FEAT_SME2 || FEAT_SVE2p1

SVE integer clamp

The encodings in this section are decoded from SVE encodings.

Decode fields U	Instruction Details	Condition
0	SCLAMP	FEAT_SME || FEAT_SVE2p1
1	UCLAMP	FEAT_SME || FEAT_SVE2p1

SVE2 multiply-add (checked pointer)

The encodings in this section are decoded from SVE encodings.

Decode fields opc	o2	Instruction Details	Condition
11	0	MLAPT	FEAT_SVE && FEAT_CPA
11	1	MADPT	FEAT_SVE && FEAT_CPA
!= 11		UNALLOCATED	-

SVE2 absolute difference and accumulate long

The encodings in this section are decoded from SVE encodings.

Decode fields U	Instruction Details	Condition
0	SABAL	FEAT_SVE2p3 || FEAT_SME2p3
1	UABAL	FEAT_SVE2p3 || FEAT_SME2p3

SVE permute vector elements (quadwords)

The encodings in this section are decoded from SVE encodings.

Decode fields opc	Instruction Details	Condition
000	ZIPQ1	FEAT_SVE2p1 || FEAT_SME2p1
001	ZIPQ2	FEAT_SVE2p1 || FEAT_SME2p1
010	UZPQ1	FEAT_SVE2p1 || FEAT_SME2p1
