ST1W (scalar plus immediate, single register)

Contiguous store words from vector (immediate index)

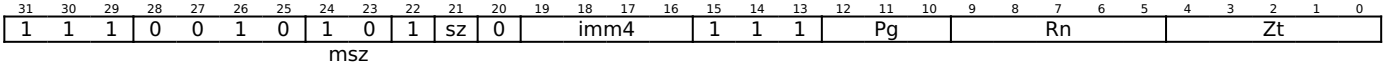
This instruction performs a contiguous store of words from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

The 128-bit element variant is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit and 64-bit elements and 128-bit element

32-bit and 64-bit elements

(FEAT_SVE || FEAT_SME)



Encoding

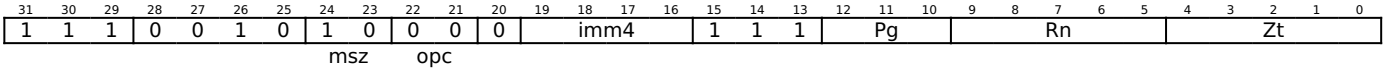
```
ST1W { <Zt>.<T> }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32 << UInt(sz);
let msize : integer{} = 32;
let offset : integer = SInt(imm4);
```

128-bit element

(FEAT_SVE2p1)



Encoding

```
ST1W { <Zt>.Q }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 128;
let msize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

Operation

```
if esize < 128 then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var addr : bits(64);
var src : bits(VL);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);
if !AnyActiveElement{PL}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
    src = Z{VL}(t);
end;
base = if n == 31 then SP{64}() else X{64}(n);
addr = AddressAdd(base, offset * elements * mbytes, accdesc);
for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        Mem{msize}(addr, accdesc) = src[e*:esize][msize-1:0];
    end;

ST1W (scalar plus scalar, consecutive registers)

Contiguous store of words from multiple consecutive vectors (scalar index)

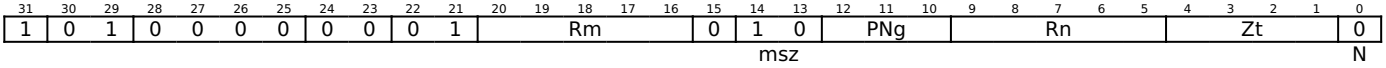
This instruction performs a contiguous store of words from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

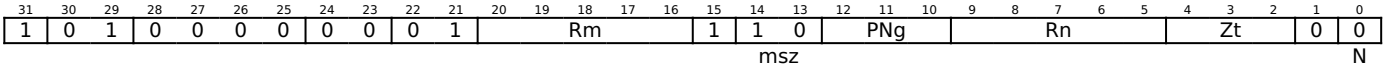
```
ST1W { <Zt1>.S-<Zt2>.S }, <PNg>, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 32;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1W { <Zt1>.S-<Zt4>.S }, <PNg>, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 32;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;

ST1W (scalar plus vector)

Scatter store words from a vector (vector index)

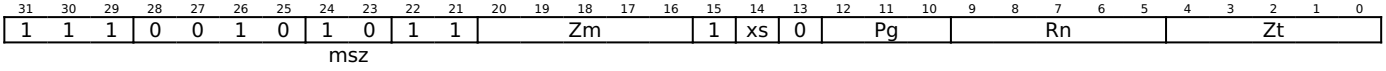
This instruction performs a scatter store of words from the Active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

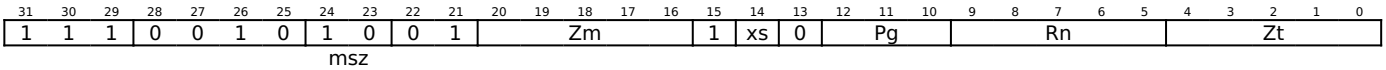
```
ST1W { <Zt>.S }, <Pg>, [<Xn|SP>, <Zm>.S, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

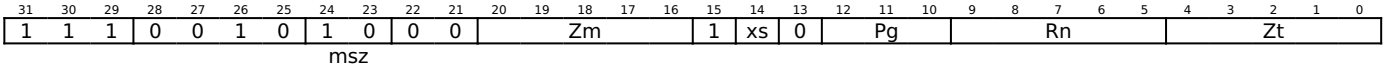
```
ST1W { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

```
ST1W { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

ST1W (vector plus immediate)

Scatter store words from a vector (immediate index)

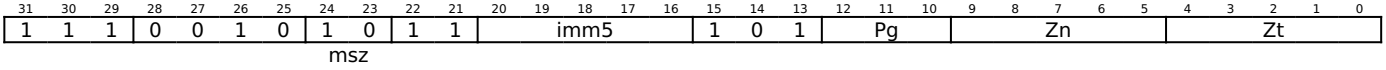
This instruction performs a scatter store of words from the Active elements of a vector register to the memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

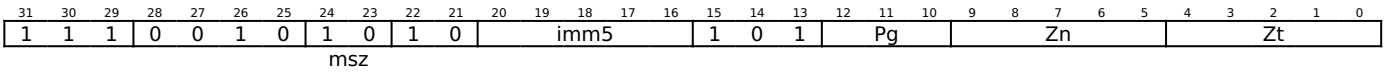
```
ST1W { <Zt>.S }, <Pg>, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
ST1W { <Zt>.D }, <Pg>, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var src : bits(VL);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = FALSE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;

ST2B (scalar plus immediate)

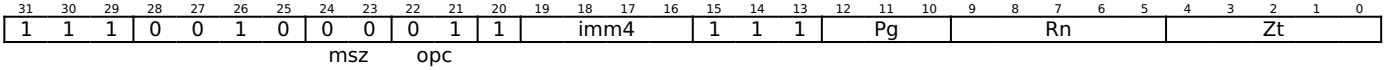
Contiguous store two-byte structures from two vectors (immediate index)

This instruction performs a contiguous store of two-byte structures, each from the same element number in two vector registers to the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST2B { <Zt1>.B, <Zt2>.B }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
let nreg : integer{} = 2;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();

ST2B (scalar plus scalar)

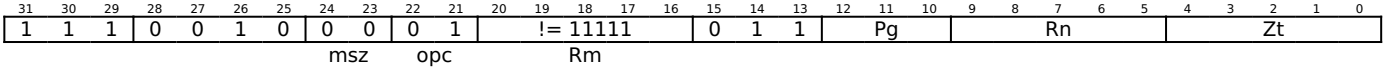
Contiguous store two-byte structures from two vectors (scalar index)

This instruction performs a contiguous store of two-byte structures, each from the same element number in two vector registers to the memory address generated by a 64-bit scalar base and a 64-bit scalar index register and added to the base address. After each structure access the index value is incremented by two. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST2B { <Zt1>.B, <Zt2>.B }, <Pg>, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let nreg : integer{} = 2;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);

ST2W (scalar plus immediate)

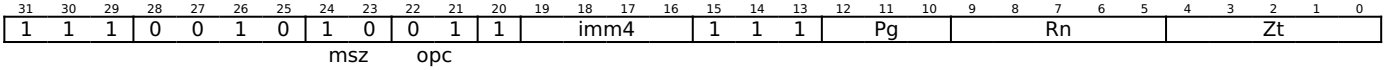
Contiguous store two-word structures from two vectors (immediate index)

This instruction performs a contiguous store of two-word structures, each from the same element number in two vector registers to the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive words in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST2W { <Zt1>.S, <Zt2>.S }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
let nreg : integer{} = 2;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var addr : bits(64);

ST3H (scalar plus scalar)

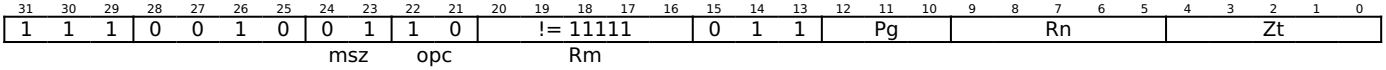
Contiguous store three-halfword structures from three vectors (scalar index)

This instruction performs a contiguous store of three-halfword structures, each from the same element number in three vector registers to the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by three. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the three vector registers, or equivalently to the three consecutive halfwords in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```

ST4D (scalar plus immediate)

Contiguous store four-doubleword structures from four vectors (immediate index)

This instruction performs a contiguous store of four-doubleword structures, each from the same element number in four vector registers to the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive doublewords in memory that make up each structure. Inactive structures are not written to memory.

SVE

ST4W (scalar plus immediate)

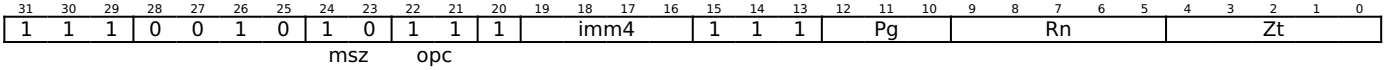
Contiguous store four-word structures from four vectors (immediate index)

This instruction performs a contiguous store of four-word structures, each from the same element number in four vector registers to the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST4W { <Zt1>.S, <Zt2>.S, <Zt3>.S, <Zt4>.S }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Zt3>	Is the name of the third scalable vector register to be transferred, encoded as "Zt" plus 2 modulo 32.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" plus 3 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;

ST4W (scalar plus scalar)

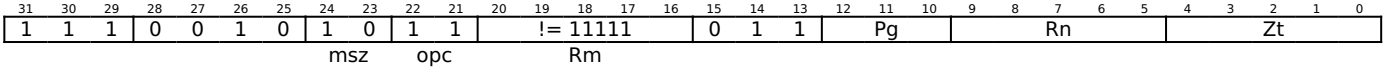
Contiguous store four-word structures from four vectors (scalar index)

This instruction performs a contiguous store of four-word structures, each from the same element number in four vector registers to the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by four. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory that make up each structure. Inactive structures are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST4W { <Zt1>.S, <Zt2>.S, <Zt3>.S, <Zt4>.S }, <Pg>, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);

STLRO

Store-release octaword

This instruction stores a 32-byte (octaword) vector register to a memory address generated by a 64-bit scalar base, plus an immediate offset. The base register must be aligned to 32 bytes if alignment is checked.

This instruction is unpredicated.

The instruction has memory ordering semantics as described in *Load-Acquire, Store-Release*.

This instruction requires that the Effective SVE vector length is at least 256 bits.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE_LRCPC)

Encoding

```
STLRO <Zt>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_LRCPC) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedVL() < 256 then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let imm : integer = UInt(imm8h::imm8l);
let acquire : boolean = FALSE;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional positive immediate byte offset, a multiple of 32 in the range 0 to 8160, defaulting to 0, encoded in the "imm8h:imm8l" fields.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < 256 then EndOfDecode(Decode_UNDEF); end;
var src : bits(VL);
var base : bits(64);
let offset : integer = imm * 32;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescAcqRel(MemOp_STORE, tagchecked, acquire, t);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;

src = Z{VL}(t);
let data : bits(256) = src[0 +: 256];

let addr : bits(64) = AddressAdd(base, offset, accdesc);

Mem{256}(addr, accdesc) = data;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

STNT1B (scalar plus immediate, consecutive registers)

Contiguous store non-temporal of bytes from multiple consecutive vectors (immediate index)

This instruction performs a contiguous non-temporal store of bytes from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

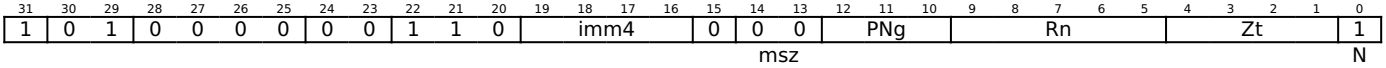
Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

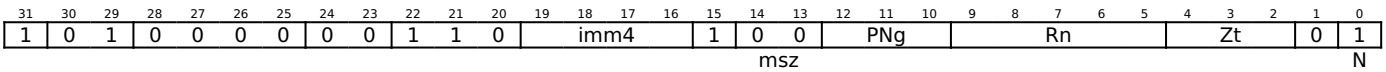
```
STNT1B { <Zt1>.B-<Zt2>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
STNT1B { <Zt1>.B-<Zt4>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```

STNT1B (vector plus scalar)

Scatter store non-temporal bytes

This instruction performs a non-temporal scatter store of bytes from the Active elements of a vector register to the memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements are not written to memory.

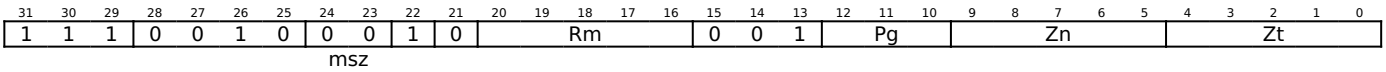
A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

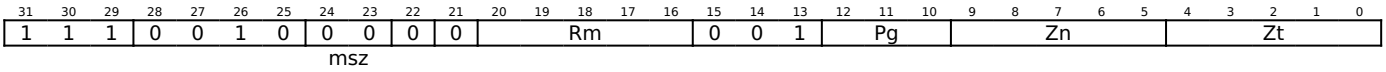
```
STNT1B { <Zt>.S }, <Pg>, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
```

64-bit unscaled offset

(FEAT_SVE2)



Encoding

```
STNT1B { <Zt>.D }, <Pg>, [<Zn>.D{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<Xm>	Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var offset : bits(64);
var src : bits(VL);
let contiguous : boolean = FALSE;
let nontemporal : boolean = TRUE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);

if AnyActiveElement{PL}(mask, esize) then
    base = Z{VL}(n);
    offset = X{64}(m);
    src = Z{VL}(t);
end;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let baddr : bits(64) = ZeroExtend{}(base[e*:esize]);
        let addr : bits(64) = AddressAdd(baddr, offset, accdesc);
        Mem{msize}(addr, accdesc) = src[e*:esize][msize-1:0];
    end;
end;
```

STNT1D (scalar plus immediate, consecutive registers)

Contiguous store non-temporal of doublewords from multiple consecutive vectors (immediate index)

This instruction performs a contiguous non-temporal store of doublewords from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

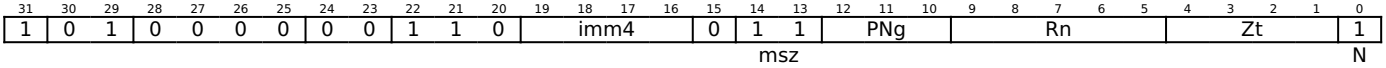
Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

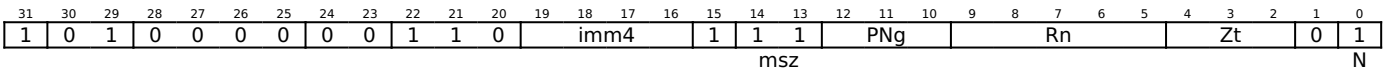
```
STNT1D { <Zt1>.D-<Zt2>.D }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
STNT1D { <Zt1>.D-<Zt4>.D }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

STNT1H (vector plus scalar)

Scatter store non-temporal halfwords

This instruction performs a non-temporal scatter store of halfwords from the Active elements of a vector register to the memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements are not written to memory.

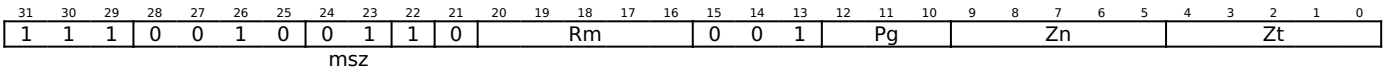
A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

```
STNT1H { <Zt>.S }, <Pg>, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);

STNT1W (scalar plus scalar, single register)

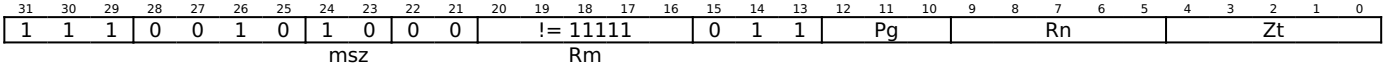
Contiguous store non-temporal words from vector (scalar index)

This instruction performs a contiguous non-temporal store of words from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
STNT1W { <Zt>.S }, <Pg>, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```

STNT1W (vector plus scalar)

Scatter store non-temporal words

This instruction performs a non-temporal scatter store of words from the Active elements of a vector register to the memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements are not written to memory.

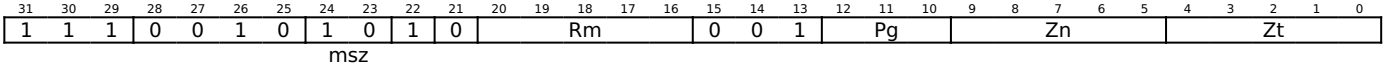
A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

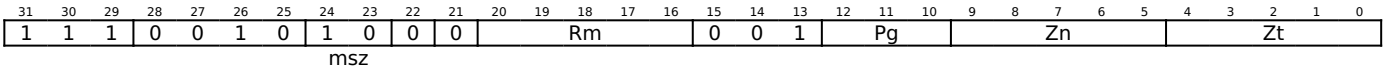
```
STNT1W { <Zt>.S }, <Pg>, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
```

64-bit unscaled offset

(FEAT_SVE2)



Encoding

```
STNT1W { <Zt>.D }, <Pg>, [<Zn>.D{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<Xm>	Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var offset : bits(64);
var src : bits(VL);
let contiguous : boolean = FALSE;
let nontemporal : boolean = TRUE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);

if AnyActiveElement{PL}(mask, esize) then
    base = Z{VL}(n);
    offset = X{64}(m);
    src = Z{VL}(t);
end;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let baddr : bits(64) = ZeroExtend{}(base[e*:esize]);
        let addr : bits(64) = AddressAdd(baddr, offset, accdesc);
        Mem{msize}(addr, accdesc) = src[e*:esize][msize-1:0];
    end;
end;
```

Operational information

STR (predicate)

Store predicate register

This instruction stores a predicate register to a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 that is multiplied by the current predicate register size in bytes. This instruction is unpredicated.

The store is performed as contiguous byte accesses, each containing 8 consecutive predicate bits in ascending element order, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then a general-purpose base register must be aligned to 2 bytes.

For programmer convenience, an assembler must also accept a predicate-as-counter register name for the source predicate register.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
STR <Pt>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Pt);
let n : integer = UInt(Rn);
let imm : integer = SInt(imm9h::imm9l);
```

Assembler Symbols

<Pt>	Is the name of the scalable predicate transfer register, encoded in the "Pt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -256 to 255, defaulting to 0, encoded in the "imm9h:imm9l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = PL DIV 8;
var src : bits(PL);
var base : bits(64);
let offset : integer = imm * elements;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;

src = P{PL}(t);

var addr : bits(64) = AddressAdd(base, offset, accdesc);

let aligned : boolean = IsAlignedSize(base, 2);

if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;

for e = 0 to elements-1 do
    AArch64_MemSingle{8}(addr, accdesc, aligned) = src[e*:8];
    addr = AddressIncrement(addr, 1, accdesc);
end;
```

Operational information

end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let imm : integer = SInt(imm9h::imm9l);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -256 to 255, defaulting to 0, encoded in the "imm9h:imm9l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 8;
var src : bits(VL);
var base : bits(64);
let offset : integer = imm * elements;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;

src = Z{VL}(t);

var addr : bits(64) = AddressAdd(base, offset, accdesc);

let aligned : boolean = IsAlignedSize(base, 16);

if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;

for e = 0 to elements-1 do
    AArch64_MemSingle{8}(addr, accdesc, aligned) = src[e*:8];
    addr = AddressIncrement(addr, 1, accdesc);
end;
```

SUB (immediate)

Subtract immediate (unpredicated)

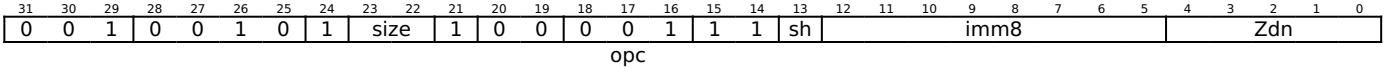
This instruction subtracts an unsigned immediate from each element of the source vector, and destructively places the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    result[e*:esize] = element1 - imm;

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

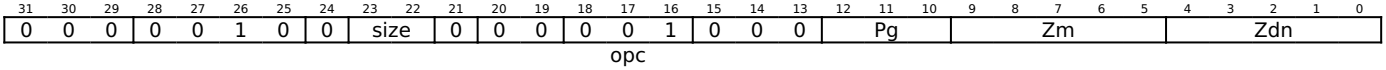
SUB (vectors, predicated)

Subtract (predicated)

This instruction subtracts Active elements of the second source vector from the corresponding elements of the first source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SUB <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 - element2;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

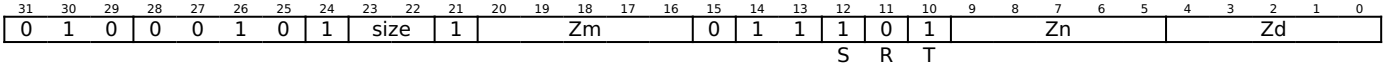
SUBHNT

Subtract narrow high part (top)

This instruction subtracts each vector element of the second source vector from the corresponding vector element in the first source vector, and places the most significant half of the result in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SUBHNT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(d);
let halfesize : integer{} = esize DIV 2;

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    let res : integer = (element1 - element2) >> halfesize;
    result[(2*e + 1)*:halfesize] = res[halfesize-1:0];

end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

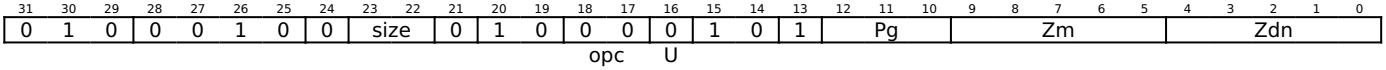
SUBP

Subtract pairwise

This instruction subtracts pairs of adjacent elements within each source vector, and destructively places the interleaved results in the first source vector.

SVE2

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

```
SUBP <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);
var element1 : integer;
var element2 : integer;

for e = 0 to elements-1 do
    if !ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = operand1[e*:esize];
    else
        if IsEven(e) then
            element1 = UInt(operand1[(e + 0)*:esize]);
            element2 = UInt(operand1[(e + 1)*:esize]);
        else
            element1 = UInt(operand2[(e - 1)*:esize]);
            element2 = UInt(operand2[(e + 0)*:esize]);
        end;
        let res : integer = element1 - element2;
        result[e*:esize] = res[esize-1:0];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

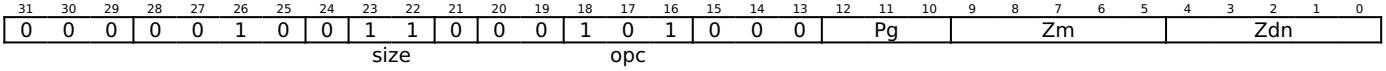
SUBPT (predicated)

Subtract checked pointer vectors (predicated)

This instruction subtracts, with pointer check, Active elements of the second source vector from corresponding elements of the first source vector and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE && FEAT_CPA)



Encoding

```
SUBPT <Zdn>.D, <Pg>/M, <Zdn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_CPA) then
    EndOfDecode(Decode_UNDEF);
end;
let g : integer =  UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer =  UInt(Zm);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV 64;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, 64) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand1[e*:64];
    let element2 : bits(64) = operand2[e*:64];
    if ActivePredicateElement{PL}(mask, e, 64) then
        let res : bits(64) = element1 - element2;
        result[e*:64] = PointerAddCheck(res, element1);
    else
        result[e*:64] = operand1[e*:64];
    end;

    Z{VL}(dn) = result;
end;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SUBPT (unpredicated)

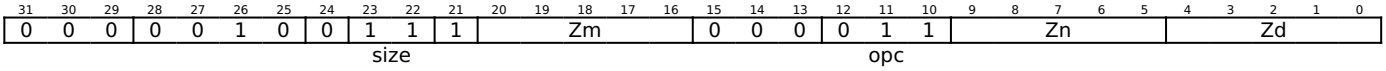
Subtract checked pointer vectors (unpredicated)

This instruction subtracts, with pointer check, all elements of the second source vector from corresponding elements of the first source vector and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE && FEAT_CPA)



Encoding

```
SUBPT <Zd>.D, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_CPA) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand1[e*:64];
    let element2 : bits(64) = operand2[e*:64];
    let res : bits(64) = element1 - element2;
    result[e*:64] = PointerAddCheck(res, element1);
end;

Z{VL}(d) = result;
```

SUBR (immediate)

Reversed subtract from immediate (unpredicated)

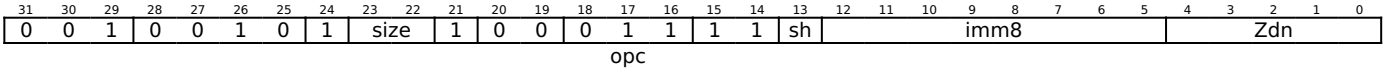
This instruction performs a reversed subtraction from an unsigned immediate each element of the source vector, and destructively places the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SUBR <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    result[e*:esize] = (imm - element1)[esize-1:0];

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

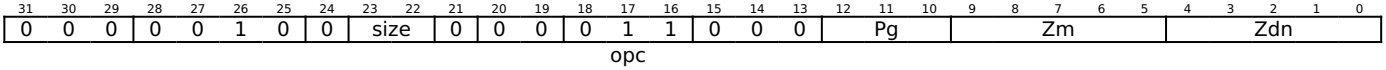
SUBR (vectors)

Reversed subtract (predicated)

This instruction performs a reversed subtraction on Active elements of the first source vector from the corresponding elements of the second source vector and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SUBR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element2 - element1;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SUDOT

Signed by unsigned 8-bit integer dot product by indexed element to 32-bit integer

This instruction calculates the dot product of a group of four signed 8-bit integer values held in each 32-bit element of the first source vector multiplied by a group of four unsigned 8-bit integer values in an indexed 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit element of the destination vector.

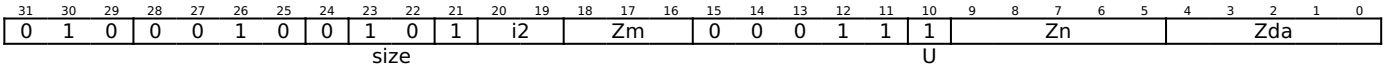
The groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

SVE

((FEAT_SVE || FEAT_SME) && FEAT_I8MM)



Encoding

```
SUDOT <Zda>.S, <Zn>.B, <Zm>.B[<imm>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_I8MM)) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index of a group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    var res : bits(esize) = operand3[e*:esize];
    for i = 0 to 3 do
        let element1 : integer = SInt(operand1[(4 * e + i)*:(esize DIV 4)]);
        let element2 : integer = UInt(operand2[(4 * s + i)*:(esize DIV 4)]);
        res = res + element1 * element2;
    end;
    result[e*:esize] = res;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SUNPKHI, SUNPKLO

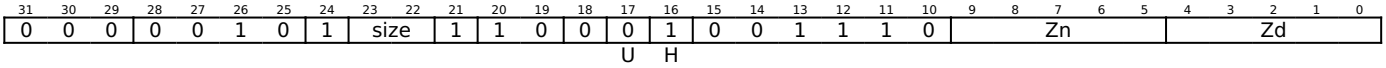
Signed unpack and extend half of vector

This instruction unpacks and sign-extends elements from the lowest or highest half of the source vector, and writes the sign-extended values into double-width elements of the destination vector. This instruction is unpredicated.

It has encodings from 2 classes: High half and Low half

High half

(FEAT_SVE || FEAT_SME)



Encoding

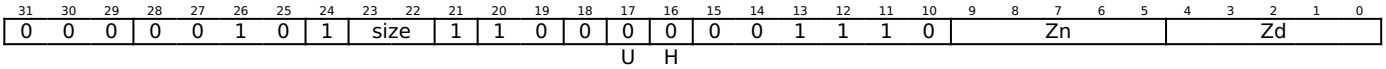
```
SUNPKHI <Zd>.<T>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let unsigned : boolean = FALSE;
let hi : boolean = TRUE;
```

Low half

(FEAT_SVE || FEAT_SME)



Encoding

```
SUNPKLO <Zd>.<T>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let unsigned : boolean = FALSE;
let hi : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let hsize : integer{} = esize DIV 2;
let offset : integer = if hi then elements else 0;
let operand : bits(VL) = Z{}(n);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : bits(hsize) = operand[(e + offset)*:hsize];
    result[e*:esize] = Extend{esize}(element, unsigned);
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

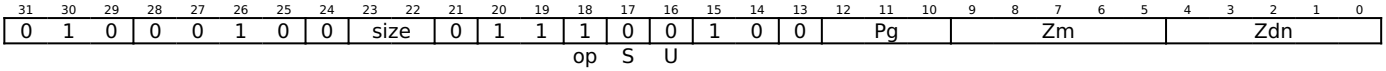
SUQADD

Signed saturating unsigned add

This instruction adds Active unsigned elements of the source vector to the corresponding signed elements of the addend vector, and destructively places the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SUQADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = SignedSat{esize}(SInt(element1) + UInt(element2));
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

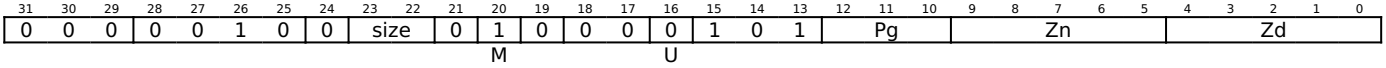
SXTB, SXTH, SXTW

Signed byte / halfword / word extend (predicated)

This instruction sign-extends the least-significant sub-element of each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.
It has encodings from 6 classes: Byte, merging , Byte, zeroing , Halfword, merging , Halfword, zeroing , Word, merging and Word, zeroing

Byte, merging

(FEAT_SVE || FEAT_SME)



Encoding

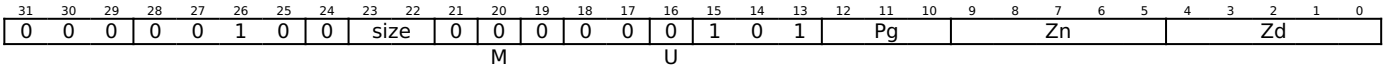
```
SXTB <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let s_esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let unsigned : boolean = FALSE;
let merging : boolean = TRUE;
```

Byte, zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
SXTB <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let s_esize : integer{} = 8;
let g : integer = UInt(Pg);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the "Byte, merging" and "Byte, zeroing" variants: is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

For the "Halfword, merging" and "Halfword, zeroing" variants: is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = Extend{esize}(element[s_esize-1:0], unsigned);
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

TBL

Programmable table lookup in one or two vector table (zeroing)

This instruction reads each element of the second source (index) vector and uses its value to select an indexed element from a table of elements consisting of one or two consecutive vector registers, where the first or only vector holds the lower numbered elements, and places the indexed table element in the destination vector element corresponding to the index vector element. If an index value is greater than or equal to the number of vector elements, then it places zero in the corresponding destination vector element.

Since the index values can select any element in a vector this operation is not naturally vector length agnostic.

It has encodings from 2 classes: Single register table and Two register table

Single register table

(FEAT_SVE || FEAT_SME)

Encoding

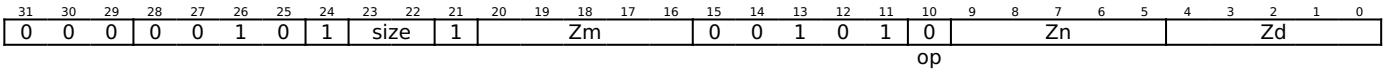
```
TBL <Zd>.<T>, { <Zn>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let double_table : boolean = FALSE;
```

Two register table

(FEAT_SVE2 || FEAT_SME)



Encoding

```
TBL <Zd>.<T>, { <Zn1>.<T>, <Zn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let double_table : boolean = TRUE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zn1> Is the name of the first scalable vector register of the first source multi-vector group, encoded in the "Zn" field.

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let indexes : bits(VL) = Z{}(m);
var result : bits(VL);
let table_size : integer{} = if double_table then VL*2 else VL;
let table_elems : integer = table_size DIV esize;
var table : bits(table_size);

if double_table then
    let top : bits(VL) = Z{}((n + 1) MOD 32);
    let bottom : bits(VL) = Z{}(n);
    table = (top::bottom)[table_size-1:0];
else
    table = Z{table_size}(n);
end;

for e = 0 to elements-1 do
    let idx : integer = UInt(indexes[e*:esize]);
    result[e*:esize] = if idx < table_elems then table[idx*:esize] else Zeros{esize};
end;

Z{VL}(d) = result;
```

Operational information

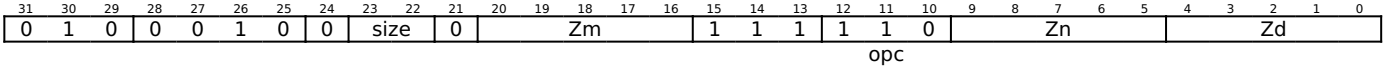
TBLQ

Programmable table lookup within each quadword vector segment (zeroing)

This instruction reads, for each 128-bit destination vector segment, each element of the corresponding second source (index) vector segment and uses its value to select an indexed element from the corresponding first source (table) vector segment. The indexed table element is placed in the element of the destination vector that corresponds to the index vector element. If an index value is greater than or equal to the number of elements in a 128-bit vector segment then it places zero in the corresponding destination vector element. This instruction is unpredicated.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
TBLQ <Zd>.<T>, { <Zn>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let elements : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for s = 0 to segments-1 do
    for e = 0 to elements-1 do
        let idx : integer = UInt(operand2[(s * elements + e)*:esize]);
        if idx < elements then
            result[(s * elements + e)*:esize] = operand1[(s * elements + idx)*:esize];
        else
            result[(s * elements + e)*:esize] = Zeros{esize};
        end;
    end;
end;

Z{VL}(d) = result;
```

Operational information

TRN1, TRN2 (vectors)

Interleave even or odd elements from two vectors

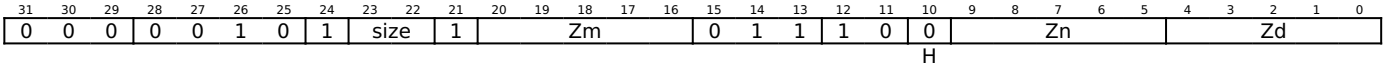
This instruction interleaves alternating even-numbered or odd-numbered elements from the first and second source vectors, and places the values in the destination vector. This instruction is unpredicated.

The Even (quadwords) and Odd (quadwords) variants require an Effective SVE vector length of at least 256 bits. ID_AA64ZFR0_EL1.F64MM or ID_AA64ZFR0_EL1.EltPerm indicates whether the Even (quadwords) and Odd (quadwords) variants are implemented. The Even (quadwords) and Odd (quadwords) variants are legal when executed in Streaming SVE mode if FEAT_SVE_PERM256 is implemented.

It has encodings from 4 classes: Even , Even (quadwords) , Odd and Odd (quadwords)

Even

(FEAT_SVE || FEAT_SME)



Encoding

```
TRN1 <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let elt1_a : integer = UInt(operand1[(2*e + 0)*:(esize DIV 2)]);
    let elt1_b : integer = UInt(operand1[(2*e + 1)*:(esize DIV 2)]);
    let elt2_a : integer = UInt(operand2[(2*e + 0)*:(esize DIV 2)]);
    let elt2_b : integer = UInt(operand2[(2*e + 1)*:(esize DIV 2)]);
    let sum = Abs(elt1_a - elt2_a) + Abs(elt1_b - elt2_b);
    result[e*:esize] = result[e*:esize] + sum[esize-1:0];
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

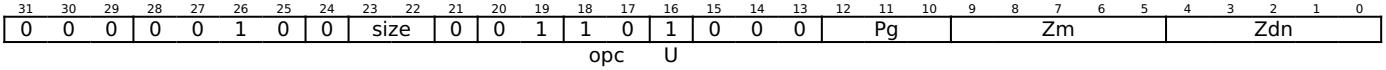
UABD

Unsigned absolute difference (predicated)

This instruction calculates the absolute difference between unsigned integer values in Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the difference in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UABD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let absdiff : integer = Abs(element1 - element2);
        result[e*:esize] = absdiff[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UCVTF (predicated)

Unsigned integer convert to floating-point (predicated)

This instruction converts to floating-point from the unsigned integer in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 14 classes: 16-bit to half-precision, merging , 16-bit to half-precision, zeroing , 32-bit to half-precision, merging , 32-bit to half-precision, zeroing , 32-bit to single-precision, merging , 32-bit to single-precision, zeroing , 32-bit to double-precision, merging , 32-bit to double-precision, zeroing , 64-bit to half-precision, merging , 64-bit to half-precision, zeroing , 64-bit to single-precision, merging , 64-bit to single-precision, zeroing , 64-bit to double-precision, merging and 64-bit to double-precision, zeroing

```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

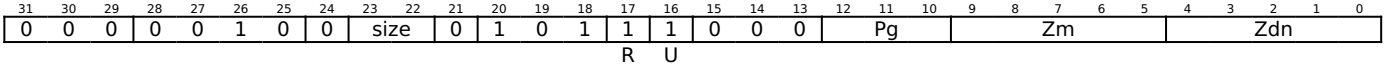
UDIVR

Unsigned reversed divide (predicated)

This instruction performs an unsigned reversed division on Active elements of the second source vector by the corresponding elements of the first source vector, and destructively places the quotient in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UDIVR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size IN {'0x'} then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let divisor : integer = UInt(operand1[e*:esize]);
        let dividend : integer = UInt(operand2[e*:esize]);
        var quotient : integer;
        if divisor == 0 then
            quotient = 0;
        else
            quotient = dividend DIVRM divisor;
        end;
        result[e*:esize] = quotient[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

UDOT (2-way, indexed)

Unsigned integer dot product by indexed element (two-way)

This instruction calculates the dot product of a pair of unsigned 8-bit or 16-bit integer values held in each 16-bit or 32-bit element of the first source vector multiplied by a pair of unsigned 8-bit or 16-bit integer values in an indexed 16-bit or 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 16-bit or 32-bit element of the destination vector.

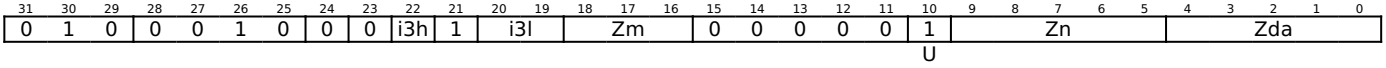
The groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 16-bit and 16-bit to 32-bit

8-bit to 16-bit

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

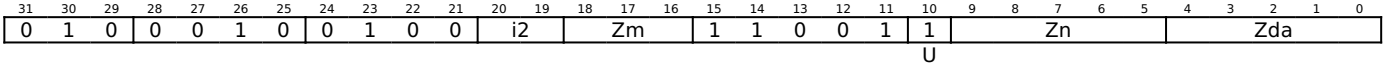
```
UDOT <Zda>.H, <Zn>.B, <Zm>.B[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

16-bit to 32-bit

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
UDOT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	For the "8-bit to 16-bit" variant: is the immediate index of a pair of 8-bit elements within each 128-bit vector segment, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "16-bit to 32-bit" variant: is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    var res : bits(esize) = operand3[e*:esize];
    for i = 0 to 1 do
        let element1 : integer = UInt(operand1[(2 * e + i)*:(esize DIV 2)]);
        let element2 : integer = UInt(operand2[(2 * s + i)*:(esize DIV 2)]);
        res = res + element1 * element2;
    end;
    result[e*:esize] = res;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

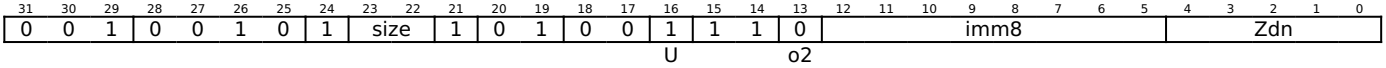
UMAX (immediate)

Unsigned maximum with immediate (unpredicated)

This instruction determines the unsigned maximum of an immediate and each element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is an unsigned 8-bit value in the range 0 to 255, inclusive. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UMAX <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let unsigned : boolean = TRUE;
let imm : integer = if unsigned then UInt(imm8) else SInt(imm8);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
    result[e*:esize] = Max(element1, imm)[esize-1:0];

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

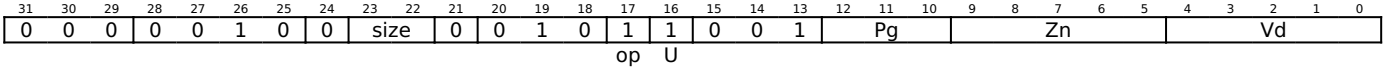
UMINV

Unsigned minimum reduction to scalar

This instruction determines the unsigned minimum of the elements of the source vector, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the maximum unsigned integer for the element size.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UMINV <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
let unsigned : boolean = TRUE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var minimum : integer = if unsigned then (2^esize - 1) else (2^(esize-1) - 1);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let opelt : bits(esize) = operand[e*:esize];
        let element : integer = if unsigned then UInt(opelt) else SInt(opelt);
        minimum = Min(minimum, element);

    end;
end;
V{esize}(d) = minimum[esize-1:0];
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMLALB (indexed)

Unsigned multiply-add long by indexed element (bottom)

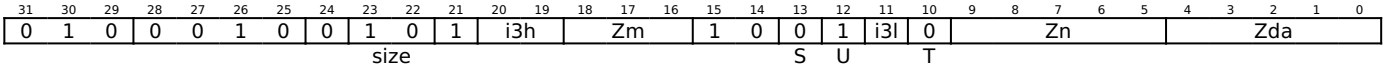
This instruction multiplies the even-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment, and destructively adds the results to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

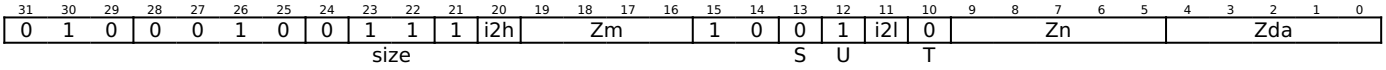
```
UMLALB <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 0;
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UMLALB <Zda>.D, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 0;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = UInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = UInt(operand2[(2 * s + index)*:esize]);
    let product : bits(2*esize) = (element1 * element2)[2*esize-1:0];
    result[e*:(2*esize)] = result[e*:(2*esize)] + product;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

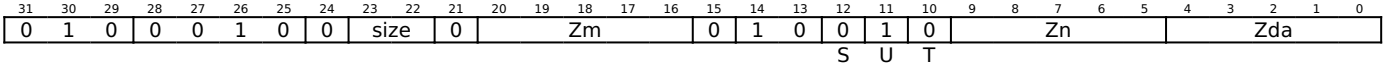
UMLALB (vectors)

Unsigned multiply-add long (bottom)

This instruction multiplies the even-numbered unsigned elements of the first source vector by the corresponding elements of the second source vector, and destructively adds the results to the overlapping double-width elements of the addend vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UMLALB <Zda>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[(2*e + 0)*:(esize DIV 2)]);
    let element2 : integer = UInt(operand2[(2*e + 0)*:(esize DIV 2)]);
    let product = (element1 * element2)[esize-1:0];
    result[e*:esize] = result[e*:esize] + product;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

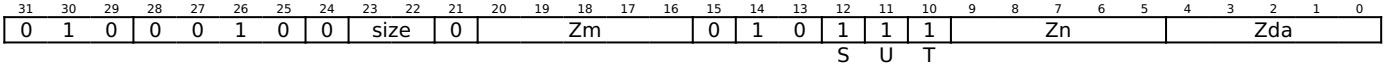
UMLSLT (vectors)

Unsigned multiply-subtract long (top)

This instruction multiplies the odd-numbered unsigned elements of the first source vector by the corresponding elements of the second source vector, and destructively subtracts the results from the overlapping double-width elements of the addend vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UMLSLT <Zda>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[(2*e + 1)*:(esize DIV 2)]);
    let element2 : integer = UInt(operand2[(2*e + 1)*:(esize DIV 2)]);
    let product = (element1 * element2)[esize-1:0];
    result[e*:esize] = result[e*:esize] - product;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UMMLA

Unsigned 8-bit integer matrix multiply-accumulate to 32-bit integer

This instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of unsigned 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

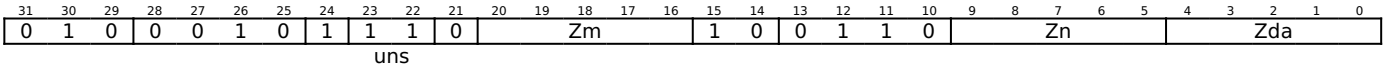
This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE && FEAT_I8MM)



Encoding

```
UMMLA <Zda>.S, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_I8MM) then
    EndOfDecode(Decode_UNDEF);
end;

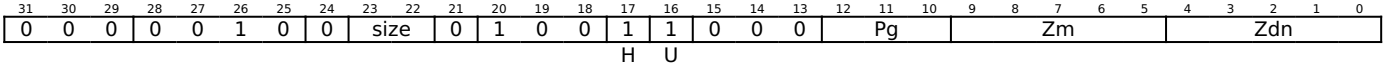
UMULH (predicated)

Unsigned multiply returning high half (predicated)

This instruction performs a widening multiplication of unsigned integer values in Active elements of the first source vector by the corresponding elements of the second source vector and destructively places the high half of the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UMULH <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let product : integer = (element1 * element2) >> esize;
        result[e*:esize] = product[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UMULLB (indexed)

Unsigned multiply long by indexed element (bottom)

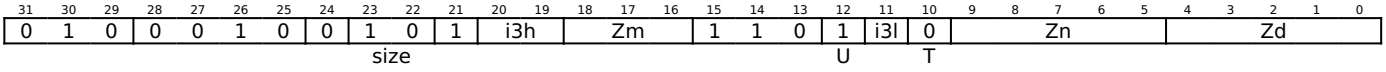
This instruction multiplies the even-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment, and places the results in the overlapping double-width elements of the destination vector register.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

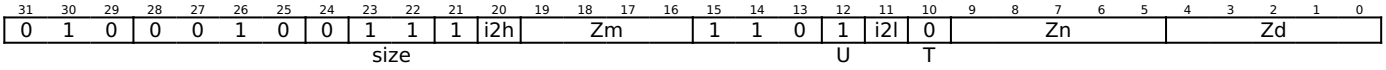
```
UMULLB <Zd>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel : integer = 0;
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UMULLB <Zd>.D, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel : integer = 0;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = UInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = UInt(operand2[(2 * s + index)*:esize]);
    let res : integer = element1 * element2;
    result[e*:(2*esize)] = res[2*esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UQADD (immediate)

Unsigned saturating add immediate (unpredicated)

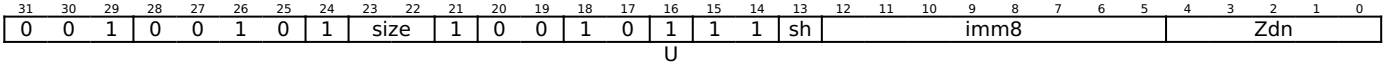
This instruction performs an unsigned saturating addition of an unsigned immediate to each element of the source vector, and destructively places the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
    (result[e*:esize], -) = SatQ{esize}(element1 + imm, unsigned);

end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = UnsignedSat{esize}(element1 + element2);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

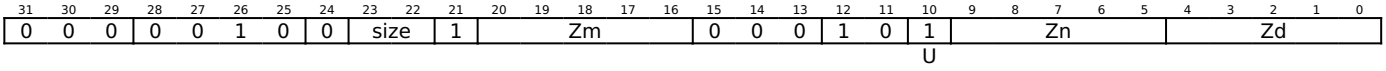
UQADD (vectors, unpredicated)

Unsigned saturating add (unpredicated)

This instruction performs an unsigned saturating addition of all elements of the first source vector to the corresponding elements of the second source vector, and places the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQADD <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    let op2elt : bits(esize) = operand2[e*:esize];
    if unsigned then
        let element1 : integer = UInt(op1elt);
        let element2 : integer = UInt(op2elt);
        (result[e*:esize], -) = UnsignedSatQ{esize}(element1 + element2);
    else
        let element1 : integer = SInt(op1elt);
        let element2 : integer = SInt(op2elt);
        (result[e*:esize], -) = SignedSatQ{esize}(element1 + element2);
    end;
end;

Z{VL}(d) = result;
```

UQCVTN

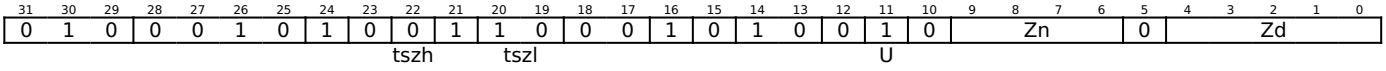
Unsigned 32-bit integer saturating extract narrow to interleaved 16-bit integer

This instruction saturates the unsigned integer value in each element of the pair of source vectors to half the original source element width, and places the two-way interleaved results in the half-width destination elements.

This instruction is unpredicated.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
UQCVTN <Zd>.H, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for e = 0 to elements-1 do
    for i = 0 to 1 do
        let operand : bits(VL) = Z{}(n+i);
        let element : integer = UInt(operand[e*:(2 * esize)]);
        result[(2*e + i)*:esize] = UnsignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

UQDECB

Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count

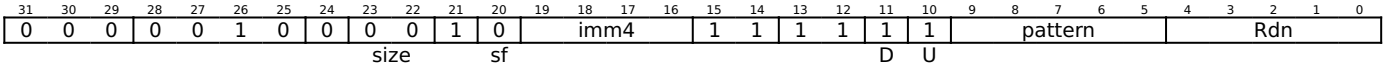
This instruction determines the number of Active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECB <Wdn>{, <pattern>{, MUL #<imm>}}
```

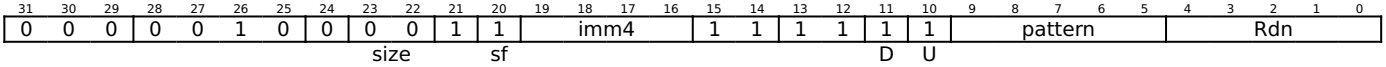
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECB <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

Operation

```
CheckSVEEnabled();
let count : integer = DecodePredCount(pat, esize);
let operand1 : bits(ssize) = X{}(dn);
var result : bits(ssize);
if unsigned then
    (result, -) = UnsignedSatQ{ssize}(UInt(operand1) - (count * imm));
else
    (result, -) = SignedSatQ{ssize}(SInt(operand1) - (count * imm));
end;
X{64}(dn) = Extend{64}(result, unsigned);
```

UQDECD (scalar)

Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count

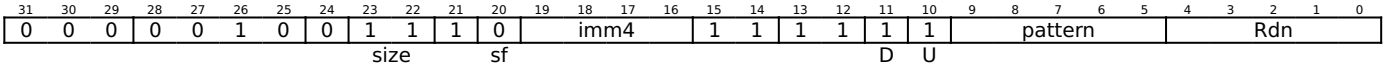
This instruction determines the number of Active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECD <Wdn>{, <pattern>{, MUL #<imm>}}
```

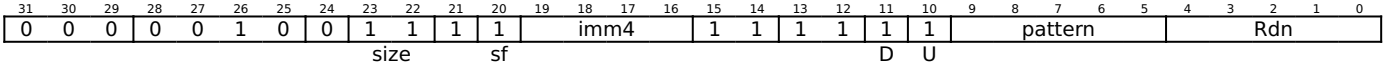
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECD <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 64;
```

Assembler Symbols

UQDECD (vector)

Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count

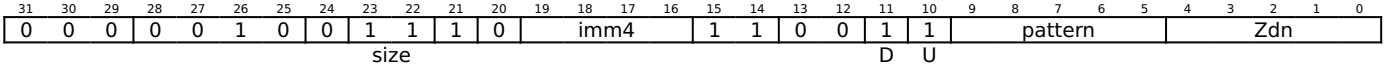
This instruction determines the number of Active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements. The results are saturated to the 64-bit unsigned integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECD <Zdn>.D{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32

UQDECP (scalar)

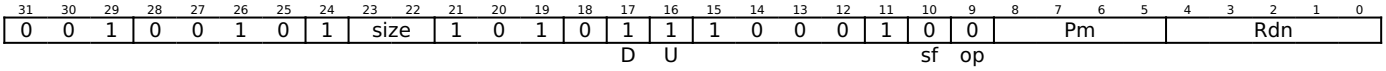
Unsigned saturating decrement scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

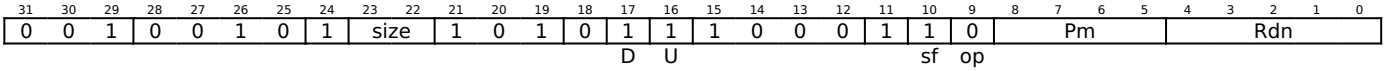
```
UQDECP <Wdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = TRUE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = TRUE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(ssize) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(ssize);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

if unsigned then
    (result, -) = UnsignedSatQ{ssize}(UInt(operand1) - count);
    X{64}(dn) = ZeroExtend{64}(result);
else
    (result, -) = SignedSatQ{ssize}(SInt(operand1) - count);
    X{64}(dn) = SignExtend{64}(result);
end;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

UQDECP (vector)

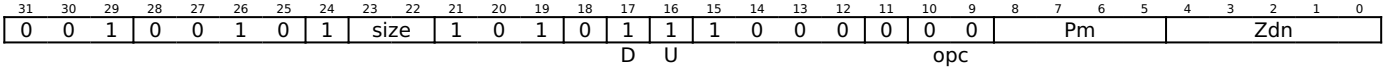
Unsigned saturating decrement vector by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element unsigned integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECP <Zdn>.<T>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Zdn);
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(VL);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

for e = 0 to elements-1 do
    let opelt : bits(esize) = operand1[e*:esize];
    if unsigned then
        (result[e*:esize], -) = UnsignedSatQ{esize}(UInt(opelt) - count);
    else
        (result[e*:esize], -) = SignedSatQ{esize}(SInt(opelt) - count);
    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UQDECW (scalar)

Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count

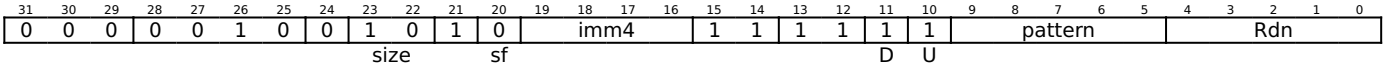
This instruction determines the number of Active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECW <Wdn>{, <pattern>{, MUL #<imm>}}
```

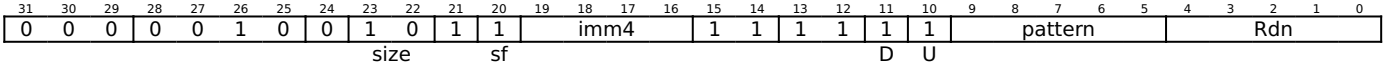
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQDECW <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256

UQINCH (vector)

Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count

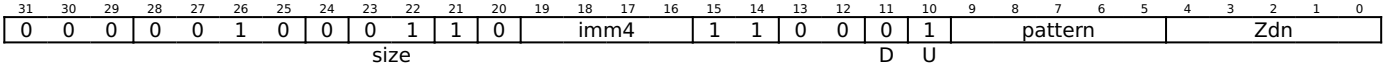
This instruction determines the number of Active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 16-bit unsigned integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQINCH <Zdn>.H{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let count : integer = DecodePredCount(pat, esize);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    if unsigned then
        (result[e*:esize], -) = UnsignedSatQ{esize}(UInt(op1elt) + (count * imm));
    else
        (result[e*:esize], -) = SignedSatQ{esize}(SInt(op1elt) + (count * imm));
    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UQINCP (scalar)

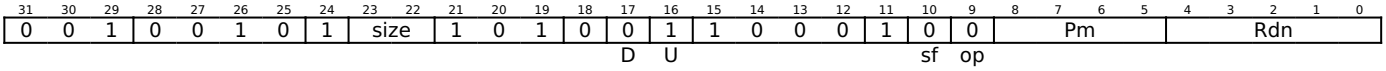
Unsigned saturating increment scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

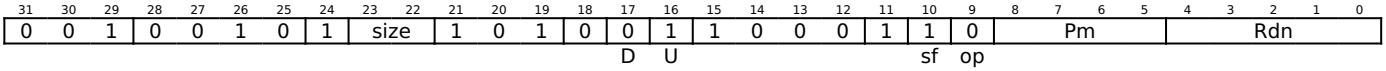
```
UQINCP <Wdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = TRUE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
UQINCP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = TRUE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(ssize) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(ssize);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

if unsigned then
    (result, -) = UnsignedSatQ{ssize}(UInt(operand1) + count);
    X{64}(dn) = ZeroExtend{64}(result);
else
    (result, -) = SignedSatQ{ssize}(SInt(operand1) + count);
    X{64}(dn) = SignExtend{64}(result);
end;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

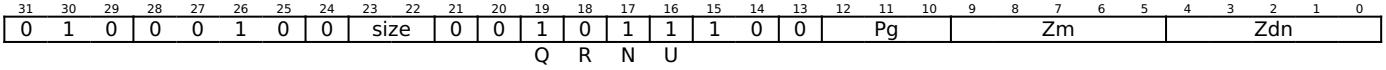
UQRSHL

Unsigned saturating rounding shift left (predicated)

This instruction shifts Active unsigned elements of the first source vector by corresponding elements of the second source vector and destructively places the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UQRSHL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

UQRSHRN

Unsigned saturating rounding shift right narrow by immediate to interleaved integer

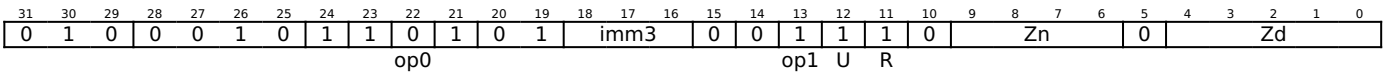
This instruction shifts right by an immediate value the unsigned integer value in each element of the two source vectors, and places the two-way interleaved rounded results in the half-width destination elements. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per destination element.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit and 16-bit

8-bit

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

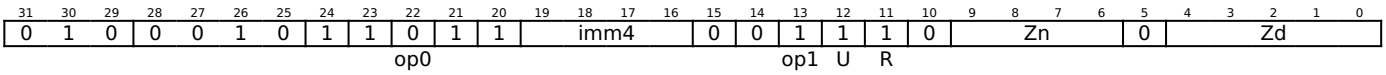
```
UQRSHRN <Zd>.B, { <Zn1>.H-<Zn2>.H }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm3);
```

16-bit

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
UQRSHRN <Zd>.H, { <Zn1>.S-<Zn2>.S }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm4);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<const>	For the "8-bit" variant: is the immediate shift amount, in the range 1 to 8, encoded as 8 minus "imm3". For the "16-bit" variant: is the immediate shift amount, in the range 1 to 16, encoded as 16 minus "imm4".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for e = 0 to elements-1 do
    for i = 0 to 1 do
        let operand : bits(VL) = Z{}(n+i);
        let element : bits(2 * esize) = operand[e*:(2 * esize)];
        let res : integer = (UInt(element) + (1 << (shift-1))) >> shift;
        result[(2*e + i)*:esize] = UnsignedSat{esize}(res);
    end;
end;

Z{VL}(d) = result;
```

UQRSHRNB

Unsigned saturating rounding shift right narrow by immediate (bottom)

This instruction shifts each unsigned integer value in the source vector elements right by an immediate value, and places the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

1x	xx	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let mask : bits(PL) = P{}(g);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let res : integer = element1 << shift;
        result[e*:esize] = UnsignedSat{esize}(res);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UQSUB (immediate)

Unsigned saturating subtract immediate (unpredicated)

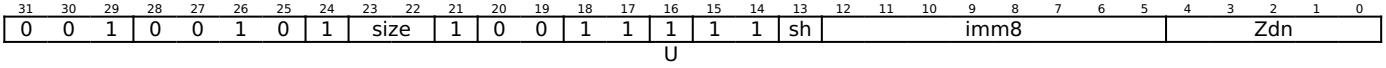
This instruction performs an unsigned saturating subtraction of an unsigned immediate from each element of the source vector, and destructively places the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
UQSUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;

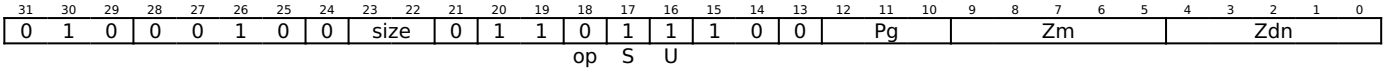
UQSUB (vectors, predicated)

Unsigned saturating subtract (predicated)

This instruction subtracts Active unsigned elements of the second source vector from corresponding unsigned elements of the first source vector and destructively places the results in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
UQSUB <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = UnsignedSat{esize}(element1 - element2);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

URECPE

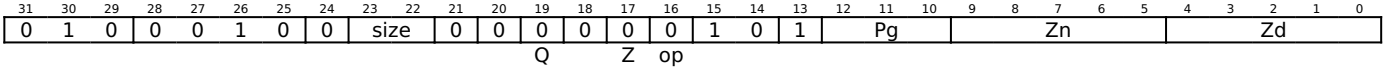
Unsigned reciprocal estimate (predicated)

This instruction finds the approximate reciprocal of each Active unsigned element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2 || FEAT_SME)



Encoding

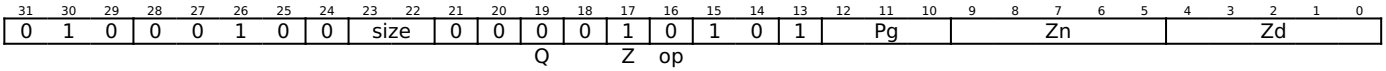
```
URECPE <Zd>.S, <Pg>/M, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
URECPE <Zd>.S, <Pg>/Z, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = UnsignedRecipEstimate{esize}(element);

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

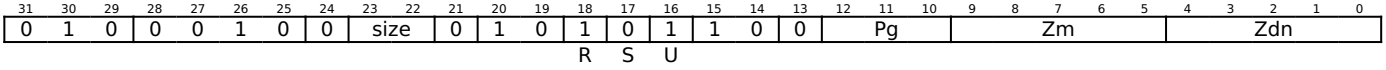
URHADD

Unsigned rounding halving add

This instruction adds Active unsigned elements of the first source vector to corresponding unsigned elements of the second source vector, shifts right one bit, and destructively places the rounded results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
URHADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let res : integer = (element1 + element2 + 1) >> 1;
        result[e*:esize] = res[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

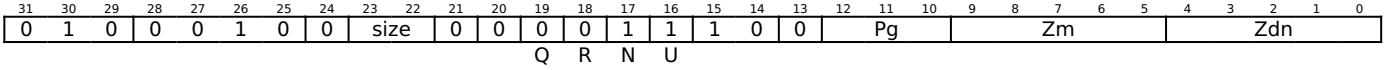
URSHL

Unsigned rounding shift left (predicated)

This instruction shifts Active unsigned elements of the first source vector by corresponding elements of the second source vector and destructively places the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
URSHL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : integer = UInt(operand1[e*:esize]);
        var shift : integer = ShiftSat(SInt(operand2[e*:esize]), esize);
        var res : integer;
        if shift >= 0 then
            res = element << shift;
        else
            shift = -shift;
            res = (element + (1 << (shift - 1))) >> shift;
        end;
        result[e*:esize] = res[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];

    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.

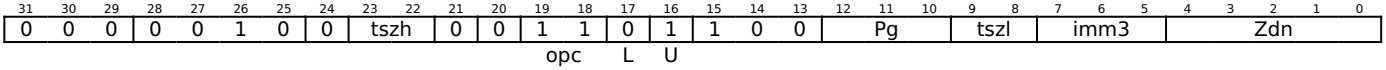
URSHR

Unsigned rounding shift right by immediate

This instruction shifts right by immediate each Active unsigned element of the source vector, and destructively places the rounded results in the corresponding elements of the source vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
URSHR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let mask : bits(PL) = P{}(g);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let res : integer = (element1 + (1 << (shift - 1))) >> shift;
        result[e*:esize] = res[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

URSQRTE

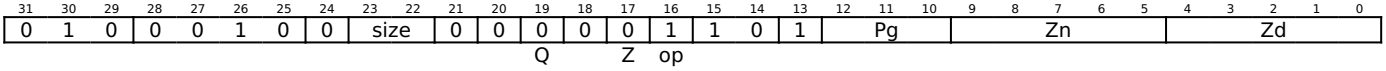
Unsigned reciprocal square root estimate (predicated)

This instruction finds the approximate reciprocal square root of each Active unsigned element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2 || FEAT_SME)



Encoding

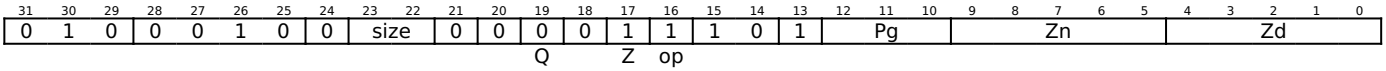
```
URSQRTE <Zd>.S, <Pg>/M, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
URSQRTE <Zd>.S, <Pg>/Z, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = UnsignedRSqrtEstimate{esize}(element);

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

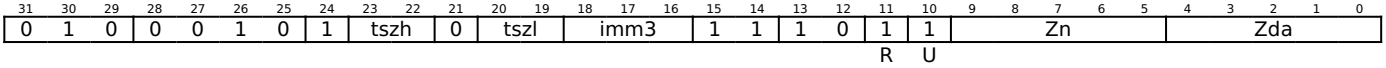
URSRA

Unsigned rounding shift right and accumulate (immediate)

This instruction shifts right by immediate each unsigned element of the source vector, inserting zeros, and destructively adds the rounded intermediate result to the corresponding elements of the addend vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
URSRA <Zda>.<T>, <Zn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let da : integer = UInt(Zda);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : integer = (UInt(operand1[e*:esize]) + (1 << (shift - 1))) >> shift;
    result[e*:esize] = operand2[e*:esize] + element[esize-1:0];
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

USDOT (indexed)

Unsigned by signed 8-bit integer dot product by indexed element to 32-bit integer

This instruction calculates the dot product of a group of four unsigned 8-bit integer values held in each 32-bit element of the first source vector multiplied by a group of four signed 8-bit integer values in an indexed 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit element of the destination vector.

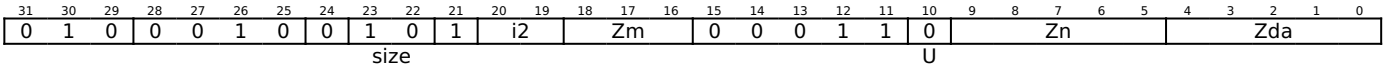
The groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

SVE

((FEAT_SVE || FEAT_SME) && FEAT_I8MM)



Encoding

```
USDOT <Zda>.S, <Zn>.B, <Zm>.B[<imm>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME)) ||
    !IsFeatureImplemented(FEAT_I8MM)) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index of a group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    var res : bits(esize) = operand3[e*:esize];
    for i = 0 to 3 do
        let element1 : integer = UInt(operand1[(4 * e + i)*:(esize DIV 4)]);
        let element2 : integer = SInt(operand2[(4 * s + i)*:(esize DIV 4)]);
        res = res + element1 * element2;
    end;
    result[e*:esize] = res;
end;

Z{VL}(da) = result;
```

Operational information

USMMLA

Unsigned by signed 8-bit integer matrix multiply-accumulate to 32-bit integer

This instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

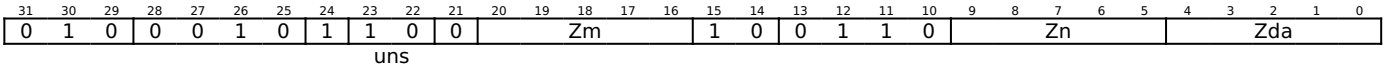
This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE && FEAT_I8MM)



Encoding

```
USMMLA <Zda>.S, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_I8MM) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_unsigned : boolean = TRUE;
let op2_unsigned : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL) = Zeros{};
var op1, op2 : bits(128);
var res, addend : bits(128);

for s = 0 to segments-1 do
    op1    = operand1[s*:(128)];
    op2    = operand2[s*:(128)];
    addend = operand3[s*:(128)];
    res    = MatMulAdd(addend, op1, op2, op1_unsigned, op2_unsigned);
    result[s*:(128)] = res;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

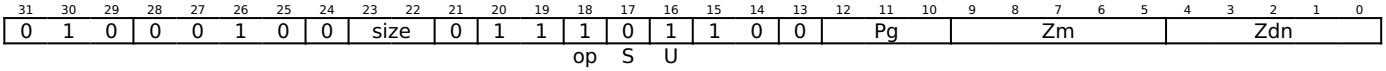
USQADD

Unsigned saturating signed add

This instruction adds Active signed elements of the source vector to the corresponding unsigned elements of the addend vector, and destructively places the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
USQADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = UnsignedSat{esize}(UInt(element1) + SInt(element2));
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

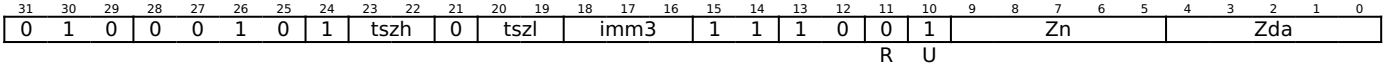
USRA

Unsigned shift right and accumulate (immediate)

This instruction shifts right by immediate each unsigned element of the source vector, inserting zeros, and destructively adds the truncated intermediate result to the corresponding elements of the addend vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
USRA <Zda>.<T>, <Zn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let da : integer = UInt(Zda);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : integer = UInt(operand1[e*:esize]) >> shift;
    result[e*:esize] = operand2[e*:esize] + element[esize-1:0];
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let unsigned : boolean = TRUE;
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the "Byte, merging" and "Byte, zeroing" variants: is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

For the "Halfword, merging" and "Halfword, zeroing" variants: is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = Extend{esize}(element[s_esize-1:0], unsigned);
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

UZP1, UZP2 (predicates)

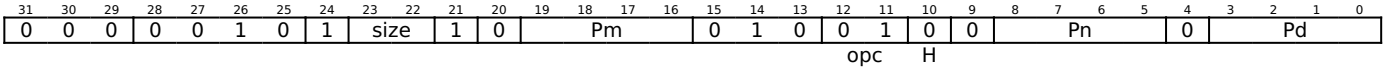
Concatenate even or odd elements from two predicates

This instruction concatenates adjacent even-numbered or odd-numbered elements from the first and second source predicates, and places the values in the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: Even and Odd

Even

(FEAT_SVE || FEAT_SME)



Encoding

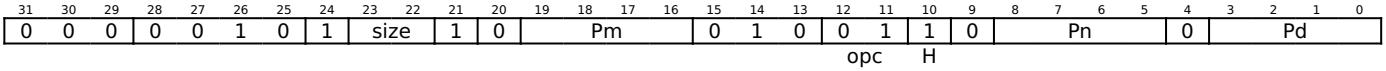
```
UZP1 <Pd>.<T>, <Pn>.<T>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let part : integer = 0;
```

Odd

(FEAT_SVE || FEAT_SME)



Encoding

```
UZP2 <Pd>.<T>, <Pn>.<T>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let part : integer = 1;
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let pairs : integer = VL DIV (esize * 2);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);

for p = 0 to pairs - 1 do
    result[p*:(esize DIV 8)] = operand1[(2*p+part)*:(esize DIV 8)];
end;

for p = 0 to pairs - 1 do
    result[(pairs+p)*:(esize DIV 8)] = operand2[(2*p+part)*:(esize DIV 8)];
end;

P{PL}(d) = result;
```

UZP1, UZP2 (vectors)

Concatenate even or odd elements from two vectors

This instruction concatenates adjacent even-numbered or odd-numbered elements from the first and second source vectors, and places the values in the destination vector. This instruction is unpredicated.

Note: UZP1 is equivalent to truncating and packing each element from two source vectors into a single destination vector with elements of half the size.

The Even (quadwords) and Odd (quadwords) variants require an Effective SVE vector length of at least 256 bits. ID_AA64ZFR0_EL1.F64MM or ID_AA64ZFR0_EL1.EltPerm indicates whether the Even (quadwords) and Odd (quadwords) variants are implemented. The Even (quadwords) and Odd (quadwords) variants are legal when executed in Streaming SVE mode if FEAT_SVE_PERM256 is implemented.

It has encodings from 4 classes: Even , Even (quadwords) , Odd and Odd (quadwords)

Even

WHILEGE (predicate as counter)

While decrementing signed scalar greater than or equal to scalar (predicate-as-counter)

This instruction generates a predicate for a group of two or four vectors that starting from the highest numbered element of the group is true while the decrementing value of the first, signed scalar operand is greater than or equal to the second scalar operand and false thereafter down to the lowest numbered element of the group.

If the second scalar operand is equal to the minimum signed integer value, then a condition that includes an equality test can never fail and the result will be an all-true predicate.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is decremented by one for each destination predicate element, irrespective of the predicate result element size.

The predicate result is placed in the predicate destination register using the predicate-as-counter encoding. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

WHILEHI (predicate as counter)

While decrementing unsigned scalar higher than scalar (predicate-as-counter)

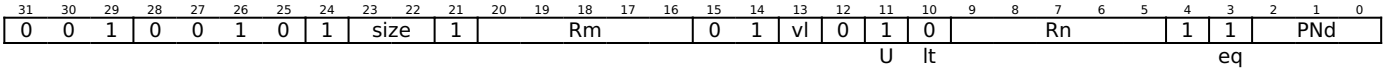
This instruction generates a predicate for a group of two or four vectors that starting from the highest numbered element of the group is true while the decrementing value of the first, unsigned scalar operand is higher than the second scalar operand and false thereafter down to the lowest numbered element of the group.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is decremented by one for each destination predicate element, irrespective of the predicate result element size.

The predicate result is placed in the predicate destination register using the predicate-as-counter encoding. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
WHILEHI <PNd>.<T>, <Xn>, <Xm>, <vl>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);

WHILELE (predicate)

While incrementing signed scalar less than or equal to scalar

This instruction generates a predicate that starting from the lowest numbered element is true while the incrementing value of the first, signed scalar operand is less than or equal to the second scalar operand and false thereafter up to the highest numbered element.

If the second scalar operand is equal to the maximum signed integer value, then a condition that includes an equality test can never fail and the result will be an all-true predicate.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is incremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.

The predicate result is placed in the predicate destination register. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE

(FEAT_SVE || FEAT_SME)

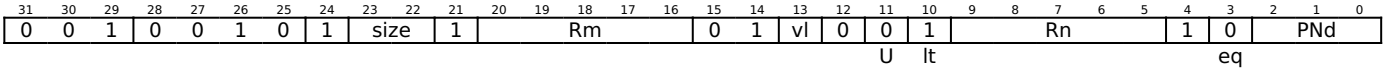
This instruction generates a predicate for a group of two or four vectors that starting from the lowest numbered element of the group is true while the incrementing value of the first, signed scalar operand is less than the second scalar operand and false thereafter up to the highest numbered element of the group.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is incremented by one for each destination predicate element, irrespective of the predicate result element size.

The predicate result is placed in the predicate destination register using the predicate-as-counter encoding. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
WHILELT <PNd>.<T>, <Xn>, <Xm>, <vl>
```

Decode for this encoding

```

WHILELT (predicate pair)

While incrementing signed scalar less than scalar (pair of predicates)

This instruction generates a pair of predicates that starting from the lowest numbered element of the pair is true while the incrementing value of the first, signed scalar operand is less than the second scalar operand and false thereafter up to the highest numbered element of the pair.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is incremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.

The lower-numbered elements are placed in the first predicate destination register, and the higher-numbered elements in the second predicate destination register. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

WHILERW

While free of read-after-write conflicts

This instruction checks two addresses for a conflict or overlap between address ranges of the form [addr,addr+VL÷8), where VL is the accessible vector length in bits, that could result in a loop-carried dependency through memory due to the use of these addresses by contiguous load and store instructions within the same iteration of a loop. Generate a predicate whose elements are true while the addresses cannot conflict within the same iteration, and false thereafter. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE2

WRFFR

Write the first-fault register

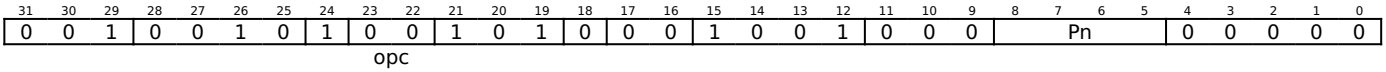
This instruction reads the source predicate register, and writes the value in the register to the first-fault register (FFR). This instruction is intended to restore a saved FFR and is not recommended for general use by applications.

This instruction requires that the source predicate contains a monotonic predicate value, in which starting from bit 0 there are zero or more 1 bits, followed only by 0 bits in any remaining bit positions. If the source is not a monotonic predicate value, then the resulting value in the FFR will be UNPREDICTABLE. It is not possible to generate a non-monotonic value in FFR when using SETFFR followed by first-fault or non-fault loads.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
WRFFR <Pn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Pn);
```

Assembler Symbols

<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckNonStreamingSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let operand : bits(PL) = P{}(n);

let hsb : integer{} = HighestSetBit(operand);
if hsb < 0 || IsOnes(operand[hsb:0]) then
    FFR{PL}() = operand;
else // not a monotonic predicate
    FFR{PL}() = ARBITRARY : bits(PL);
end;
```

let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
let rot : integer = 2 * esize - UInt(tsize::imm3);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = ROR(element1 XOR element2, rot);
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

ZIP1, ZIP2 (vectors)

Interleave elements from two half vectors

This instruction interleaves alternating elements from the lowest or highest halves of the first and second source vectors, and places the values in the destination vector. This instruction is unpredicated.

The High halves (quadwords) and Low halves (quadwords) variants require an Effective SVE vector length of at least 256 bits. ID_AA64ZFR0_EL1.F64MM or ID_AA64ZFR0_EL1.EltPerm indicates whether the High halves (quadwords) and Low halves (quadwords) variants are implemented. The High halves (quadwords) and Low halves (quadwords) variants are legal when executed in Streaming SVE mode if FEAT_SVE_PERM256 is implemented.

It has encodings from 4 classes: High halves , High halves (quadwords) , Low halves and Low halves (quadwords)

High halves

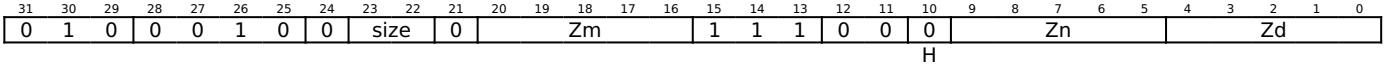
ZIPQ1

Interleave elements from low halves of each pair of quadword vector segments

This instruction interleaves alternating elements from low halves of the corresponding 128-bit vector segments of the first and second source vectors, and places them in the corresponding elements of the destination vector segment. This instruction is unpredicated.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
ZIPQ1 <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let part : integer = 0;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let elements : integer = 128 DIV esize;
let pairs : integer = elements DIV 2;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for s = 0 to segments-1 do
    let base : integer = s * elements + part * pairs;
    for p = 0 to pairs-1 do
        result[(s * elements + 2 * p + 0)*:esize] = operand1[(base + p)*:esize];
        result[(s * elements + 2 * p + 1)*:esize] = operand2[(base + p)*:esize];
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ZIPQ2

Interleave elements from high halves of each pair of quadword vector segments

This instruction interleaves alternating elements from high halves of the corresponding 128-bit vector segments of the first and second source vectors, and places them in the corresponding elements of the destination vector segment. This instruction is unpredicated.

SVE2

A64 -- SME Instructions (alphabetic order)

ADD (to array, array and multiple vectors): Multi-vector accumulate to ZA array vectors.

ADD (to array, multiple and single vector): Multi-vector add by vector to ZA array vectors.

ADD (to array, multiple vectors): Multi-vector add to ZA array vectors.

ADD (to vector, multiple vectors): Multi-vector add by vector to multi-vector.

ADDHA: Add horizontally vector elements to ZA tile.

ADDSPL: Add multiple of Streaming SVE predicate register size to scalar register.

ADDSVL: Add multiple of Streaming SVE vector register size to scalar register.

ADDVA: Add vertically vector elements to ZA tile.

BF1CVT, BF2CVT: Multi-vector 8-bit floating-point convert to BFloat16.

BF1CVTL, BF2CVTL: Multi-vector 8-bit floating-point convert to deinterleaved BFloat16.

BFADD: Multi-vector BFloat16 accumulate to ZA array vectors.

BFCLAMP: Multi-vector BFloat16 clamp to minimum/maximum number.

BFCVT (BFloat16 to 8-bit floating-point): Multi-vector BFloat16 convert to 8-bit floating-point.

BFCVT (single-precision to BFloat16): Multi-vector single-precision convert to BFloat16.

BFCVTN: Multi-vector single-precision convert to interleaved BFloat16.

BFDOT (multiple and indexed vector): Multi-vector BFloat16 dot product by indexed element to single-precision.

BFDOT (multiple and single vector): Multi-vector BFloat16 dot product by vector to single-precision.

BFDOT (multiple vectors): Multi-vector BFloat16 dot product to single-precision.

BFMAX (multiple and single vector): Multi-vector BFloat16 maximum by vector.

BFMAX (multiple vectors): Multi-vector BFloat16 maximum.

BFMAXNM (multiple and single vector): Multi-vector BFloat16 maximum number by vector.

BFMAXNM (multiple vectors): Multi-vector BFloat16 maximum number.

BFMIN (multiple and single vector): Multi-vector BFloat16 minimum by vector.

BFMIN (multiple vectors): Multi-vector BFloat16 minimum.

BFMINNM (multiple and single vector): Multi-vector BFloat16 minimum number by vector.

BFMINNM (multiple vectors): Multi-vector BFloat16 minimum number.

BFMLA (multiple and indexed vector): Multi-vector BFloat16 fused multiply-add by indexed element.

BFMLA (multiple and single vector): Multi-vector BFloat16 fused multiply-add by vector.

BFMLA (multiple vectors): Multi-vector BFloat16 fused multiply-add.

BFMLAL (multiple and indexed vector): Multi-vector BFloat16 multiply-add by indexed element to single-precision.

BFMLAL (multiple and single vector): Multi-vector BFloat16 multiply-add by vector to single-precision.

BFMLAL (multiple vectors): Multi-vector BFloat16 multiply-add to single-precision.

BFMLS (multiple and indexed vector): Multi-vector BFloat16 fused multiply-subtract by indexed element.

BFMLS (multiple and single vector): Multi-vector BFloat16 fused multiply-subtract by vector.

BFMLS (multiple vectors): Multi-vector BFloat16 fused multiply-subtract.

BFMLSL (multiple and indexed vector): Multi-vector BFloat16 multiply-subtract by indexed element from single-precision.

BFMLSL (multiple and single vector): Multi-vector BFloat16 multiply-subtract by vector from single-precision.

BFMLSL (multiple vectors): Multi-vector BFloat16 multiply-subtract from single-precision.

BFMOP4A (non-widening): BFloat16 quarter-tile outer product, accumulating.

BFMOP4A (widening): BFloat16 quarter-tile sum of outer products to single-precision, accumulating.

BFMOP4S (non-widening): BFloat16 quarter-tile outer product, subtracting.

BFMOP4S (widening): BFloat16 quarter-tile sum of outer products to single-precision, subtracting.

BFMOPA (non-widening): BFloat16 outer product, accumulating.

BFMOPA (widening): BFloat16 sum of outer products to single-precision, accumulating.

BFMOPS (non-widening): BFloat16 outer product, subtracting.

BFMOPS (widening): BFloat16 sum of outer products to single-precision, subtracting.

BFMUL (multiple and single vector): Multi-vector BFloat16 multiply by vector.

BFMUL (multiple vectors): Multi-vector BFloat16 multiply.

BFSCALE (multiple and single vector): Multi-vector BFloat16 adjust exponent by vector.

BFSCALE (multiple vectors): Multi-vector BFloat16 adjust exponent.

BFSUB: Multi-vector BFloat16 subtract from ZA array vectors.

BFTMOPA (non-widening): BFloat16 sparse outer product, accumulating.

BFTMOPA (widening): BFloat16 sparse sum of outer products to single-precision, accumulating.

BFVDOT: Multi-vector BFloat16 vertical dot product by indexed element to single-precision.

BMOPA: Bitwise exclusive NOR population count outer product, accumulating.

BMOPS: Bitwise exclusive NOR population count outer product, subtracting.

F1CVT, F2CVT: Multi-vector 8-bit floating-point convert to half-precision.

F1CVTL, F2CVTL: Multi-vector 8-bit floating-point convert to deinterleaved half-precision.

FADD: Multi-vector floating-point accumulate to ZA array vectors.

FAMAX: Multi-vector floating-point absolute maximum.

FAMIN: Multi-vector floating-point absolute minimum.

FCLAMP: Multi-vector floating-point clamp to minimum/maximum number.

FCVT (narrowing, FP16 to FP8): Multi-vector half-precision convert to 8-bit floating-point.

FCVT (narrowing, FP32 to FP16): Multi-vector single-precision convert to half-precision.

FCVT (narrowing, FP32 to FP8): Multi-vector single-precision convert to 8-bit floating-point.

FCVT (widening): Multi-vector half-precision convert to single-precision.

FCVTL: Multi-vector half-precision convert to deinterleaved single-precision.

FCVTN (FP32 to FP16): Multi-vector single-precision convert to interleaved half-precision.

FCVTN (FP32 to FP8): Multi-vector single-precision convert to interleaved 8-bit floating-point.

FCVTZS: Multi-vector single-precision convert to signed 32-bit integer, rounding toward zero.

FCVTZU: Multi-vector single-precision convert to unsigned 32-bit integer, rounding toward zero.

FDOT (2-way, multiple and indexed vector, FP16 to FP32): Multi-vector half-precision dot product by indexed element to single-precision.

FDOT (2-way, multiple and indexed vector, FP8 to FP16): Multi-vector 8-bit floating-point dot product by indexed element to half-precision.

FDOT (2-way, multiple and single vector, FP16 to FP32): Multi-vector half-precision dot product by vector to single-precision.

FDOT (2-way, multiple and single vector, FP8 to FP16): Multi-vector 8-bit floating-point dot product by vector to half-precision.

FDOT (2-way, multiple vectors, FP16 to FP32): Multi-vector half-precision dot product to single-precision.

FDOT (2-way, multiple vectors, FP8 to FP16): Multi-vector 8-bit floating-point dot product to half-precision.

FDOT (4-way, multiple and indexed vector): Multi-vector 8-bit floating-point dot product by indexed element to single-precision.

FDOT (4-way, multiple and single vector): Multi-vector 8-bit floating-point dot product by vector to single-precision.

FDOT (4-way, multiple vectors): Multi-vector 8-bit floating-point dot product to single-precision.

FMAX (multiple and single vector): Multi-vector floating-point maximum by vector.

FMAX (multiple vectors): Multi-vector floating-point maximum.

FMAXNM (multiple and single vector): Multi-vector floating-point maximum number by vector.

FMAXNM (multiple vectors): Multi-vector floating-point maximum number.

FMIN (multiple and single vector): Multi-vector floating-point minimum by vector.

FMIN (multiple vectors): Multi-vector floating-point minimum.

FMINNM (multiple and single vector): Multi-vector floating-point minimum number by vector.

FMINNM (multiple vectors): Multi-vector floating-point minimum number.

FMLA (multiple and indexed vector): Multi-vector floating-point fused multiply-add by indexed element.

FMLA (multiple and single vector): Multi-vector floating-point fused multiply-add by vector.

FMLA (multiple vectors): Multi-vector floating-point fused multiply-add.

FMLAL (multiple and indexed vector, FP16 to FP32): Multi-vector half-precision multiply-add by indexed element to single-precision.

FMLAL (multiple and indexed vector, FP8 to FP16): Multi-vector 8-bit floating-point multiply-add by indexed element to half-precision.

FMLAL (multiple and single vector, FP16 to FP32): Multi-vector half-precision multiply-add by vector to single-precision.

FMLAL (multiple and single vector, FP8 to FP16): Multi-vector 8-bit floating-point multiply-add by vector to half-precision.

FMLAL (multiple vectors, FP16 to FP32): Multi-vector half-precision multiply-add to single-precision.

FMLAL (multiple vectors, FP8 to FP16): Multi-vector 8-bit floating-point multiply-add to half-precision.

FMLALL (multiple and indexed vector): Multi-vector 8-bit floating-point multiply-add by indexed element to single-precision.

FMLALL (multiple and single vector): Multi-vector 8-bit floating-point multiply-add by vector to single-precision.

FMLALL (multiple vectors): Multi-vector 8-bit floating-point multiply-add to single-precision.

FMLS (multiple and indexed vector): Multi-vector floating-point fused multiply-subtract by indexed element.

FMLS (multiple and single vector): Multi-vector floating-point fused multiply-subtract by vector.

FMLS (multiple vectors): Multi-vector floating-point fused multiply-subtract.

FMLSL (multiple and indexed vector): Multi-vector half-precision multiply-subtract by indexed element from single-precision.

FMLSL (multiple and single vector): Multi-vector half-precision multiply-subtract by vector from single-precision.

FMLSL (multiple vectors): Multi-vector half-precision multiply-subtract from single-precision.

FMOP4A (non-widening): Floating-point quarter-tile outer product, accumulating.

FMOP4A (widening, 2-way, FP16 to FP32): Half-precision quarter-tile sum of outer products to single-precision, accumulating.

FMOP4A (widening, 2-way, FP8 to FP16): 8-bit floating-point quarter-tile sum of outer products to half-precision, accumulating.

FMOP4A (widening, 4-way): 8-bit floating-point quarter-tile sum of outer products to single-precision, accumulating.

FMOP4S (non-widening): Floating-point quarter-tile outer product, subtracting.

FMOP4S (widening): Half-precision quarter-tile sum of outer products to single-precision, subtracting.

FMOPA (non-widening): Floating-point outer product, accumulating.

FMOPA (widening, 2-way, FP16 to FP32): Half-precision sum of outer products to single-precision, accumulating.

FMOPA (widening, 2-way, FP8 to FP16): 8-bit floating-point sum of outer products to half-precision, accumulating.

FMOPA (widening, 4-way): 8-bit floating-point sum of outer products to single-precision, accumulating.

FMOPS (non-widening): Floating-point outer product, subtracting.

FMOPS (widening): Half-precision sum of outer products to single-precision, subtracting.

FMUL (multiple and single vector): Multi-vector floating-point multiply by vector.

FMUL (multiple vectors): Multi-vector floating-point multiply.

FRINTA: Multi-vector single-precision round to integral value, to nearest with ties away from zero.

FRINTM: Multi-vector single-precision round to integral value, toward minus Infinity.

FRINTN: Multi-vector single-precision round to integral value, to nearest with ties to even.

FRINTP: Multi-vector single-precision round to integral value, toward plus Infinity.

FSCALE (multiple and single vector): Multi-vector floating-point adjust exponent by vector.

FSCALE (multiple vectors): Multi-vector floating-point adjust exponent.

FSUB: Multi-vector floating-point subtract from ZA array vectors.

FTMOPA (non-widening): Floating-point sparse outer product, accumulating.

FTMOPA (widening, 2-way, FP16 to FP32): Half-precision sparse sum of outer products to single-precision, accumulating.

FTMOPA (widening, 2-way, FP8 to FP16): 8-bit floating-point sparse sum of outer products to half-precision, accumulating.

FTMOPA (widening, 4-way): 8-bit floating-point sparse sum of outer products to single-precision, accumulating.

FVDOT (FP16 to FP32): Multi-vector half-precision vertical dot product by indexed element to single-precision.

FVDOT (FP8 to FP16): Multi-vector 8-bit floating-point vertical dot product by indexed element to half-precision.

FVDOTB: Multi-vector 8-bit floating-point vertical dot product by indexed element to single-precision (bottom).

FVDOTT: Multi-vector 8-bit floating-point vertical dot product by indexed element to single-precision (top).

LD1B (scalar plus immediate, strided registers): Contiguous load of bytes to multiple strided vectors (immediate index).

LD1B (scalar plus scalar, strided registers): Contiguous load of bytes to multiple strided vectors (scalar index).

LD1B (scalar plus scalar, tile slice): Contiguous load of bytes to 8-bit element ZA tile slice.

LD1D (scalar plus immediate, strided registers): Contiguous load of doublewords to multiple strided vectors (immediate index).

LD1D (scalar plus scalar, strided registers): Contiguous load of doublewords to multiple strided vectors (scalar index).

LD1D (scalar plus scalar, tile slice): Contiguous load of doublewords to 64-bit element ZA tile slice.

LD1H (scalar plus immediate, strided registers): Contiguous load of halfwords to multiple strided vectors (immediate index).

LD1H (scalar plus scalar, strided registers): Contiguous load of halfwords to multiple strided vectors (scalar index).

LD1H (scalar plus scalar, tile slice): Contiguous load of halfwords to 16-bit element ZA tile slice.

LD1Q: Contiguous load of quadwords to 128-bit element ZA tile slice.

LD1W (scalar plus immediate, strided registers): Contiguous load of words to multiple strided vectors (immediate index).

LD1W (scalar plus scalar, strided registers): Contiguous load of words to multiple strided vectors (scalar index).

LD1W (scalar plus scalar, tile slice): Contiguous load of words to 32-bit element ZA tile slice.

LDNT1B (scalar plus immediate, strided registers): Contiguous load non-temporal of bytes to multiple strided vectors (immediate index).

LDNT1B (scalar plus scalar, strided registers): Contiguous load non-temporal of bytes to multiple strided vectors (scalar index).

LDNT1D (scalar plus immediate, strided registers): Contiguous load non-temporal of doublewords to multiple strided vectors (immediate index).

LDNT1D (scalar plus scalar, strided registers): Contiguous load non-temporal of doublewords to multiple strided vectors (scalar index).

LDNT1H (scalar plus immediate, strided registers): Contiguous load non-temporal of halfwords to multiple strided vectors (immediate index).

LDNT1H (scalar plus scalar, strided registers): Contiguous load non-temporal of halfwords to multiple strided vectors (scalar index).

LDNT1W (scalar plus immediate, strided registers): Contiguous load non-temporal of words to multiple strided vectors (immediate index).

LDNT1W (scalar plus scalar, strided registers): Contiguous load non-temporal of words to multiple strided vectors (scalar index).

LDR (array vector): Load ZA array vector.

LDR (table): Load ZT0 register.

LUTI2 (four registers): Lookup table read with 2-bit indexes (four registers).

LUTI2 (single): Lookup table read with 2-bit indexes (single).

LUTI2 (two registers): Lookup table read with 2-bit indexes (two registers).

LUTI4 (four registers, 16-bit and 32-bit): Lookup table read with 4-bit indexes (four registers).

LUTI4 (four registers, 8-bit): Lookup table read with 4-bit indexes and 8-bit elements (four registers).

LUTI4 (single): Lookup table read with 4-bit indexes (single).

LUTI4 (two registers): Lookup table read with 4-bit indexes (two registers).

LUTI6 (table, four registers, 8-bit): Lookup table read with 6-bit indices (8-bit).

LUTI6 (table, single, 8-bit): Lookup table read with 6-bit indices (single).

LUTI6 (vector, 16-bit): Lookup table read with 6-bit indices (16-bit).

MOV (array to vector, four registers): Move four ZA single-vector groups to Z four-vector operand: an alias of MOVA (array to vector, four registers).

MOV (array to vector, two registers): Move two ZA single-vector groups to Z two-vector operand: an alias of MOVA (array to vector, two registers).

MOV (tile to vector, four registers): Move ZA four-slice operand to Z four-vector operand: an alias of MOVA (tile to vector, four registers).

MOV (tile to vector, single): Move ZA tile slice to Z vector: an alias of MOVA (tile to vector, single).

MOV (tile to vector, two registers): Move ZA two-slice operand to Z two-vector operand: an alias of MOVA (tile to vector, two registers).

MOV (vector to array, four registers): Move Z four-vector operand to four ZA single-vector groups: an alias of MOVA (vector to array, four registers).

MOV (vector to array, two registers): Move Z two-vector operand to two ZA single-vector groups: an alias of MOVA (vector to array, two registers).

MOV (vector to tile, four registers): Move Z four-vector operand to ZA four-slice operand: an alias of MOVA (vector to tile, four registers).

MOV (vector to tile, single): Move Z vector to ZA tile slice: an alias of MOVA (vector to tile, single).

MOV (vector to tile, two registers): Move Z two-vector operand to ZA two-slice operand: an alias of MOVA (vector to tile, two registers).

MOVA (array to vector, four registers): Move four ZA single-vector groups to Z four-vector operand.

MOVA (array to vector, two registers): Move two ZA single-vector groups to Z two-vector operand.

MOVA (tile to vector, four registers): Move ZA four-slice operand to Z four-vector operand.

MOVA (tile to vector, single): Move ZA tile slice to Z vector.

MOVA (tile to vector, two registers): Move ZA two-slice operand to Z two-vector operand.

MOVA (vector to array, four registers): Move Z four-vector operand to four ZA single-vector groups.

MOVA (vector to array, two registers): Move Z two-vector operand to two ZA single-vector groups.

MOVA (vector to tile, four registers): Move Z four-vector operand to ZA four-slice operand.

MOVA (vector to tile, single): Move Z vector to ZA tile slice.

MOVA (vector to tile, two registers): Move Z two-vector operand to ZA two-slice operand.

MOVAZ (array to vector, four registers): Move and zero four ZA single-vector groups to Z four-vector operand.

MOVAZ (array to vector, two registers): Move and zero two ZA single-vector groups to Z two-vector operand.

MOVAZ (tile to vector, four registers): Move and zero ZA four-slice operand to Z four-vector operand.

MOVAZ (tile to vector, single): Move and zero ZA tile slice to Z vector.

MOVAZ (tile to vector, two registers): Move and zero ZA two-slice operand to Z two-vector operand.

MOVT (scalar to table): Move 8 bytes from general-purpose register to ZT0.

MOVT (table to scalar): Move 8 bytes from ZT0 to general-purpose register.

MOVT (vector to table): Move vector register to ZT0.

RDSVL: Read multiple of Streaming SVE vector register size to scalar register.

SCLAMP: Multi-vector signed clamp to minimum/maximum.

SCVTF: Multi-vector signed 32-bit integer convert to single-precision.

SDOT (2-way, multiple and indexed vector): Multi-vector signed 16-bit integer dot product by indexed element to 32-bit integer.

SDOT (2-way, multiple and single vector): Multi-vector signed 16-bit integer dot product by vector to 32-bit integer.

SDOT (2-way, multiple vectors): Multi-vector signed 16-bit integer dot product to 32-bit integer.

SDOT (4-way, multiple and indexed vector): Multi-vector signed integer dot product by indexed element.

SDOT (4-way, multiple and single vector): Multi-vector signed integer dot product by vector.

SDOT (4-way, multiple vectors): Multi-vector signed integer dot product.

SEL: Multi-vector conditional select.

SMAX (multiple and single vector): Multi-vector signed maximum by vector.

SMAX (multiple vectors): Multi-vector signed maximum.

SMIN (multiple and single vector): Multi-vector signed minimum by vector.

SMIN (multiple vectors): Multi-vector signed minimum.

SMLAL (multiple and indexed vector): Multi-vector signed 16-bit integer multiply-add by indexed element to 32-bit integer.

SMLAL (multiple and single vector): Multi-vector signed 16-bit integer multiply-add by vector to 32-bit integer.

SMLAL (multiple vectors): Multi-vector signed 16-bit integer multiply-add to 32-bit integer.

SMLALL (multiple and indexed vector): Multi-vector signed integer multiply-add long long by indexed element.

SMLALL (multiple and single vector): Multi-vector signed integer multiply-add long long by vector.

SMLALL (multiple vectors): Multi-vector signed integer multiply-add long long.

SMLSL (multiple and indexed vector): Multi-vector signed 16-bit integer multiply-subtract by indexed element from 32-bit integer.

SMLSL (multiple and single vector): Multi-vector signed 16-bit integer multiply-subtract by vector from 32-bit integer.

SMLSL (multiple vectors): Multi-vector signed 16-bit integer multiply-subtract from 32-bit integer.

SMLSLL (multiple and indexed vector): Multi-vector signed integer multiply-subtract long long by indexed element.

SMLSLL (multiple and single vector): Multi-vector signed integer multiply-subtract long long by vector.

SMLSLL (multiple vectors): Multi-vector signed integer multiply-subtract long long.

SMOP4A (2-way): Signed 16-bit integer quarter-tile sum of outer products to 32-bit integer, accumulating.

SMOP4A (4-way): Signed integer quarter-tile sum of outer products, accumulating.

SMOP4S (2-way): Signed 16-bit integer quarter-tile sum of outer products to 32-bit integer, subtracting.

SMOP4S (4-way): Signed integer quarter-tile sum of outer products, subtracting.

SMOPA (2-way): Signed 16-bit integer sum of outer products to 32-bit integer, accumulating.

SMOPA (4-way): Signed integer sum of outer products, accumulating.

SMOPS (2-way): Signed 16-bit integer sum of outer products to 32-bit integer, subtracting.

SMOPS (4-way): Signed integer sum of outer products, subtracting.

SQCVT (four registers): Multi-vector signed saturating extract narrow.

SQCVT (two registers): Multi-vector signed 32-bit integer saturating extract narrow to 16-bit integer.

SQCVTN: Multi-vector signed saturating extract narrow to interleaved integer.

SQCVTU (four registers): Multi-vector signed saturating extract narrow to unsigned integer.

SQCVTU (two registers): Multi-vector signed 32-bit integer saturating extract narrow to unsigned 16-bit integer.

SQCVTUN: Multi-vector signed saturating extract narrow to interleaved unsigned integer.

SQDMULH (multiple and single vector): Multi-vector signed saturating doubling multiply high by vector.

SQDMULH (multiple vectors): Multi-vector signed saturating doubling multiply high.

SQRSHR (four registers): Multi-vector signed saturating rounding shift right narrow by immediate.

SQRSHR (two registers): Multi-vector signed 32-bit integer saturating rounding shift right narrow by immediate to 16-bit integer.

SQRSHRN: Multi-vector signed saturating rounding shift right narrow by immediate to interleaved integer.

SQRSHRU (four registers): Multi-vector signed saturating rounding shift right narrow by immediate to unsigned integer.

SQRSHRU (two registers): Multi-vector signed 32-bit integer saturating rounding shift right narrow by immediate to unsigned 16-bit integer.

SQRSHRUN: Multi-vector signed saturating rounding shift right narrow by immediate to interleaved unsigned integer.

SRSHL (multiple and single vector): Multi-vector signed rounding shift left by vector.

SRSHL (multiple vectors): Multi-vector signed rounding shift left.

ST1B (scalar plus immediate, strided registers): Contiguous store of bytes from multiple strided vectors (immediate index).

ST1B (scalar plus scalar, strided registers): Contiguous store of bytes from multiple strided vectors (scalar index).

ST1B (scalar plus scalar, tile slice): Contiguous store of bytes from 8-bit element ZA tile slice.

ST1D (scalar plus immediate, strided registers): Contiguous store of doublewords from multiple strided vectors (immediate index).

ST1D (scalar plus scalar, strided registers): Contiguous store of doublewords from multiple strided vectors (scalar index).

ST1D (scalar plus scalar, tile slice): Contiguous store of doublewords from 64-bit element ZA tile slice.

ST1H (scalar plus immediate, strided registers): Contiguous store of halfwords from multiple strided vectors (immediate index).

ST1H (scalar plus scalar, strided registers): Contiguous store of halfwords from multiple strided vectors (scalar index).

ST1H (scalar plus scalar, tile slice): Contiguous store of halfwords from 16-bit element ZA tile slice.

ST1Q: Contiguous store of quadwords from 128-bit element ZA tile slice.

ST1W (scalar plus immediate, strided registers): Contiguous store of words from multiple strided vectors (immediate index).

ST1W (scalar plus scalar, strided registers): Contiguous store of words from multiple strided vectors (scalar index).

ST1W (scalar plus scalar, tile slice): Contiguous store of words from 32-bit element ZA tile slice.

STMOPA (2-way): Signed 16-bit integer sparse sum of outer products to 32-bit integer, accumulating.

STMOPA (4-way): Signed 8-bit integer sparse sum of outer products to 32-bit integer, accumulating.

STNT1B (scalar plus immediate, strided registers): Contiguous store non-temporal of bytes from multiple strided vectors (immediate index).

STNT1B (scalar plus scalar, strided registers): Contiguous store non-temporal of bytes from multiple strided vectors (scalar index).

STNT1D (scalar plus immediate, strided registers): Contiguous store non-temporal of doublewords from multiple strided vectors (immediate index).

STNT1D (scalar plus scalar, strided registers): Contiguous store non-temporal of doublewords from multiple strided vectors (scalar index).

STNT1H (scalar plus immediate, strided registers): Contiguous store non-temporal of halfwords from multiple strided vectors (immediate index).

STNT1H (scalar plus scalar, strided registers): Contiguous store non-temporal of halfwords from multiple strided vectors (scalar index).

STNT1W (scalar plus immediate, strided registers): Contiguous store non-temporal of words from multiple strided vectors (immediate index).

STNT1W (scalar plus scalar, strided registers): Contiguous store non-temporal of words from multiple strided vectors (scalar index).

STR (array vector): Store ZA array vector.

STR (table): Store ZT0 register.

SUB (to array, array and multiple vectors): Multi-vector subtract from ZA array vectors.

SUB (to array, multiple and single vector): Multi-vector subtract by vector to ZA array vectors.

SUB (to array, multiple vectors): Multi-vector subtract to ZA array vectors.

SUDOT (4-way, multiple and indexed vector): Multi-vector signed by unsigned 8-bit integer dot product by indexed elements to 32-bit integer.

SUDOT (4-way, multiple and single vector): Multi-vector signed by unsigned 8-bit integer dot product by vector to 32-bit integer.

SUMLALL (multiple and indexed vector): Multi-vector signed by unsigned 8-bit integer multiply-add by indexed element to 32-bit integer.

SUMLALL (multiple and single vector): Multi-vector signed by unsigned 8-bit integer multiply-add by vector to 32-bit integer.

SUMOP4A: Signed by unsigned integer quarter-tile sum of outer products, accumulating.

SUMOP4S: Signed by unsigned integer quarter-tile sum of outer products, subtracting.

SUMOPA (4-way): Signed by unsigned integer sum of outer products, accumulating.

SUMOPS: Signed by unsigned integer sum of outer products, subtracting.

SUNPK: Unpack and sign-extend multi-vector elements.

SUTMOPA: Signed by unsigned 8-bit integer sparse sum of outer products to 32-bit integer, accumulating.

SUVDOT: Multi-vector signed by unsigned 8-bit integer vertical dot product by indexed element to 32-bit integer.

SVDOT (2-way): Multi-vector signed 16-bit integer vertical dot product by indexed element to 32-bit integer.

SVDOT (4-way): Multi-vector signed integer vertical dot product by indexed element.

UCLAMP: Multi-vector unsigned clamp to minimum/maximum.

UCVTF: Multi-vector unsigned 32-bit integer convert to single-precision.

UDOT (2-way, multiple and indexed vector): Multi-vector unsigned 16-bit integer dot product by indexed element to 32-bit integer.

UDOT (2-way, multiple and single vector): Multi-vector unsigned 16-bit integer dot product by vector to 32-bit integer.

UDOT (2-way, multiple vectors): Multi-vector unsigned 16-bit integer dot product to 32-bit integer.

UDOT (4-way, multiple and indexed vector): Multi-vector unsigned integer dot product by indexed element.

UDOT (4-way, multiple and single vector): Multi-vector unsigned integer dot product by vector.

UDOT (4-way, multiple vectors): Multi-vector unsigned integer dot product.

UMAX (multiple and single vector): Multi-vector unsigned maximum by vector.

UMAX (multiple vectors): Multi-vector unsigned maximum.

UMIN (multiple and single vector): Multi-vector unsigned minimum by vector.

UMIN (multiple vectors): Multi-vector unsigned minimum.

UMLAL (multiple and indexed vector): Multi-vector unsigned 16-bit integer multiply-add by indexed element to 32-bit integer.

UMLAL (multiple and single vector): Multi-vector unsigned 16-bit integer multiply-add by vector to 32-bit integer.

UMLAL (multiple vectors): Multi-vector unsigned 16-bit integer multiply-add to 32-bit integer.

UMLALL (multiple and indexed vector): Multi-vector unsigned integer multiply-add long long by indexed element.

UMLALL (multiple and single vector): Multi-vector unsigned integer multiply-add long long by vector.

UMLALL (multiple vectors): Multi-vector unsigned integer multiply-add long long.

UMLSL (multiple and indexed vector): Multi-vector unsigned 16-bit integer multiply-subtract by indexed element from 32-bit integer.

UMLSL (multiple and single vector): Multi-vector unsigned 16-bit integer multiply-subtract by vector from 32-bit integer.

UMLSL (multiple vectors): Multi-vector unsigned 16-bit integer multiply-subtract from 32-bit integer.

UMLSLL (multiple and indexed vector): Multi-vector unsigned integer multiply-subtract long long by indexed element.

UMLSLL (multiple and single vector): Multi-vector unsigned integer multiply-subtract long long by vector.

UMLSLL (multiple vectors): Multi-vector unsigned integer multiply-subtract long long.

UMOP4A (2-way): Unsigned 16-bit integer quarter-tile sum of outer products to 32-bit integer, accumulating.

UMOP4A (4-way): Unsigned integer quarter-tile sum of outer products, accumulating.

UMOP4S (2-way): Unsigned 16-bit integer quarter-tile sum of outer products to 32-bit integer, subtracting.

UMOP4S (4-way): Unsigned integer quarter-tile sum of outer products, subtracting.

UMOPA (2-way): Unsigned 16-bit integer sum of outer products to 32-bit integer, accumulating.

UMOPA (4-way): Unsigned integer sum of outer products, accumulating.

UMOPS (2-way): Unsigned 16-bit integer sum of outer products to 32-bit integer, subtracting.

UMOPS (4-way): Unsigned integer sum of outer products, subtracting.

UQCVT (four registers): Multi-vector unsigned saturating extract narrow.

UQCVT (two registers): Multi-vector unsigned 32-bit integer saturating extract narrow to 16-bit integer.

UQCVTN: Multi-vector unsigned saturating extract narrow to interleaved integer.

UQRSHR (four registers): Multi-vector unsigned saturating rounding shift right narrow by immediate.

UQRSHR (two registers): Multi-vector unsigned 32-bit integer saturating rounding shift right narrow by immediate to 16-bit integer.

UQRSHRN: Multi-vector unsigned saturating rounding shift right narrow by immediate to interleaved integer.

URSHL (multiple and single vector): Multi-vector unsigned rounding shift left by vector.

URSHL (multiple vectors): Multi-vector unsigned rounding shift left.

USDOT (4-way, multiple and indexed vector): Multi-vector unsigned by signed 8-bit integer dot product by indexed element to 32-bit integer.

USDOT (4-way, multiple and single vector): Multi-vector unsigned by signed 8-bit integer dot product by vector to 32-bit integer.

USDOT (4-way, multiple vectors): Multi-vector unsigned by signed 8-bit integer dot product to 32-bit integer.

USMLALL (multiple and indexed vector): Multi-vector unsigned by signed 8-bit integer multiply-add by indexed element to 32-bit integer.

USMLALL (multiple and single vector): Multi-vector unsigned by signed 8-bit integer multiply-add by vector to 32-bit integer.

USMLALL (multiple vectors): Multi-vector unsigned by signed 8-bit integer multiply-add to 32-bit integer.

USMOP4A: Unsigned by signed integer quarter-tile sum of outer products, accumulating.

USMOP4S: Unsigned by signed integer quarter-tile sum of outer products, subtracting.

USMOPA (4-way): Unsigned by signed integer sum of outer products, accumulating.

USMOPS: Unsigned by signed integer sum of outer products, subtracting.

USTMOPA: Unsigned by signed 8-bit integer sparse sum of outer products to 32-bit integer, accumulating.

USVDOT: Multi-vector unsigned by signed 8-bit integer vertical dot product by indexed element to 32-bit integer.

UTMOPA (2-way): Unsigned 16-bit integer sparse sum of outer products to 32-bit integer, accumulating.

UTMOPA (4-way): Unsigned 8-bit integer sparse sum of outer products to 32-bit integer, accumulating.

UUNPK: Unpack and zero-extend multi-vector elements.

UVDOT (2-way): Multi-vector unsigned 16-bit integer vertical dot product by indexed element to 32-bit integer.

UVDOT (4-way): Multi-vector unsigned integer vertical dot product by indexed element.

UZP (four registers): Concatenate elements from four vectors.

UZP (two registers): Concatenate elements from two vectors.

ZERO (double-vector): Zero ZA double-vector groups.

ZERO (quad-vector): Zero ZA quad-vector groups.

ZERO (single-vector): Zero ZA single-vector groups.

ZERO (table): Zero ZT0.

ZERO (tiles): Zero a list of 64-bit element ZA tiles.

ZIP (four registers): Interleave elements from four vectors.

ZIP (two registers): Interleave elements from two vectors.

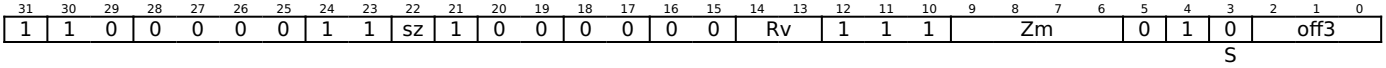
ADD (to array, array and multiple vectors)

Multi-vector accumulate to ZA array vectors

This instruction destructively adds all elements of the two or four source vectors to the corresponding elements of the ZA single-vector groups.
The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.
ID_AA64SMFR0_EL1.I16I64 indicates whether the 64-bit integer variant is implemented.
It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))



Encoding

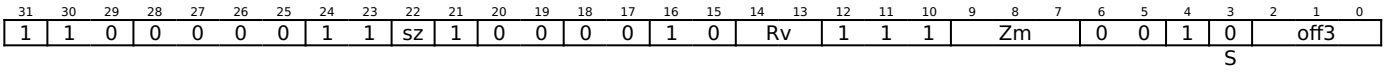
```
ADD ZA.<T>[<Wv>, <offs>{, VGx2}], { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if sz == '1' && !IsFeatureImplemented(FEAT_SME_I16I64) then
    EndOfDecode(Decode_UNDEF);
end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32 << UInt(sz);
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))



Encoding

```
ADD ZA.<T>[<Wv>, <offs>{, VGx4}], { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if sz == '1' && !IsFeatureImplemented(FEAT_SME_I16I64) then
    EndOfDecode(Decode_UNDEF);
end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32 << UInt(sz);
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(off3);
let nreg : integer{} = 4;
```

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.

<offs> Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

<Zm1> For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 2.

For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zm4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = ZAvector{VL}(vec);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = element1 + element2;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADD (to vector, multiple vectors)

Multi-vector add by vector to multi-vector

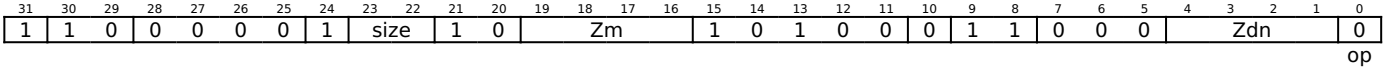
This instruction adds elements of the second source vector to the corresponding elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

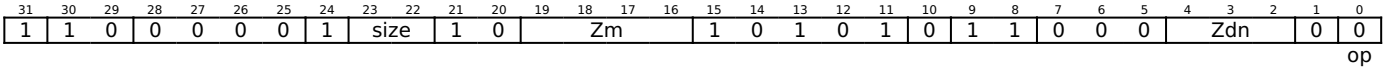
```
ADD { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
ADD { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        results[[r]][e*:esize] = element1 + element2;
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADDHA

Add horizontally vector elements to ZA tile

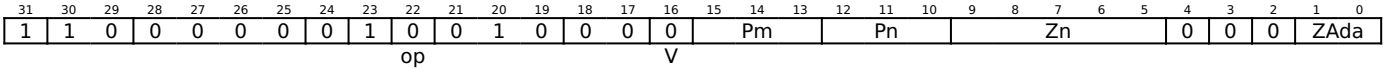
This instruction adds each element of the source vector to the corresponding Active element of each horizontal slice of a ZA tile. The tile elements are predicated by a pair of governing predicates. An element of a horizontal slice is considered Active if its corresponding element in the second governing predicate is TRUE and the element corresponding to its horizontal slice number in the first governing predicate is TRUE. Inactive elements in the destination tile remain unmodified.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 64-bit integer variant is implemented.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SME)



Encoding

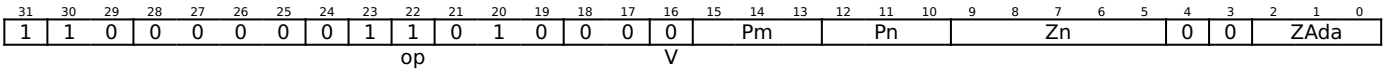
```
ADDHA <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let da : integer = UInt(ZAda);
```

64-bit

(FEAT_SME_I16I64)



Encoding

```
ADDHA <ZAda>.D, <Pn>/M, <Pm>/M, <Zn>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_I16I64) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let da : integer = UInt(ZAda);
```

Assembler Symbols

<ZAda>	For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field. For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7, encoded in the "ZAda" field.
<Pn>	Is the name of the first governing scalable predicate register P0-P7, encoded in the "Pn" field.
<Pm>	Is the name of the second governing scalable predicate register P0-P7, encoded in the "Pm" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer{} = VL DIV esize;
let mask1 : bits(PL) = P{PL}(a);
let mask2 : bits(PL) = P{PL}(b);
let operand_src : bits(VL) = Z{VL}(n);
let operand_acc : bits(dim*dim*esize) = ZAtile{dim*dim*esize}(da, esize);
var result : bits(dim*dim*esize);

for col = 0 to dim-1 do
    let element : bits(esize) = operand_src[col*:esize];
    for row = 0 to dim-1 do
        var res : bits(esize) = operand_acc[(row*dim+col)*:esize];
        if (ActivePredicateElement{PL}(mask1, row, esize) &&
              ActivePredicateElement{PL}(mask2, col, esize)) then
            res = res + element;
        end;
        result[(row*dim+col)*:esize] = res;
    end;
end;

ZAtile{dim*dim*esize}(da, esize) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADDSPL

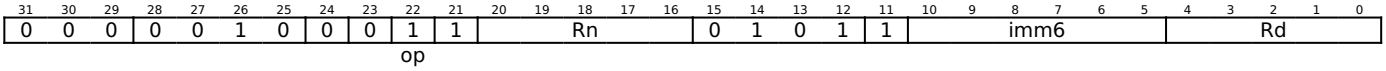
Add multiple of Streaming SVE predicate register size to scalar register

This instruction adds the Streaming SVE predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and places the result in the 64-bit destination general-purpose register or current stack pointer.

This instruction does not require the PE to be in Streaming SVE mode.

SME

(FEAT_SME)



Encoding

```
ADDSPL <Xd|SP>, <Xn|SP>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd|SP>	Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Xn|SP>	Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSMEEnabled();
let SVL : integer = CurrentSVL();
let len : integer = imm * (SVL DIV 64);
let operand1 : bits(64) = if n == 31 then SP{64}() else X{64}(n);
let result : bits(64) = operand1 + len;

if d == 31 then
    SP{64}() = result;
else
    X{64}(d) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADDSVL

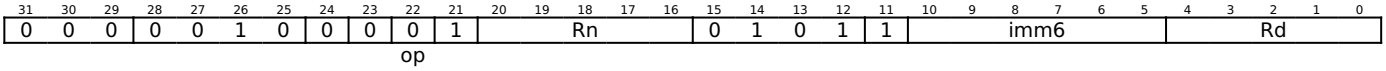
Add multiple of Streaming SVE vector register size to scalar register

This instruction adds the Streaming SVE vector register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer, and places the result in the 64-bit destination general-purpose register or current stack pointer.

This instruction does not require the PE to be in Streaming SVE mode.

SME

(FEAT_SME)



Encoding

```
ADDSVL <Xd|SP>, <Xn|SP>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd|SP>	Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Xn|SP>	Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSMEEnabled();
let SVL : integer = CurrentSVL();
let len : integer = imm * (SVL DIV 8);
let operand1 : bits(64) = if n == 31 then SP{64}() else X{64}(n);
let result : bits(64) = operand1 + len;

if d == 31 then
    SP{64}() = result;
else
    X{64}(d) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ADDVA

Add vertically vector elements to ZA tile

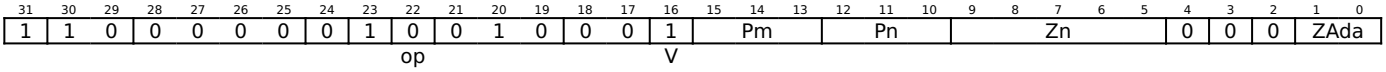
This instruction adds each element of the source vector to the corresponding Active element of each vertical slice of a ZA tile. The tile elements are predicated by a pair of governing predicates. An element of a vertical slice is considered Active if its corresponding element in the first governing predicate is TRUE and the element corresponding to its vertical slice number in the second governing predicate is TRUE. Inactive elements in the destination tile remain unmodified.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 64-bit integer variant is implemented.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SME)



Encoding

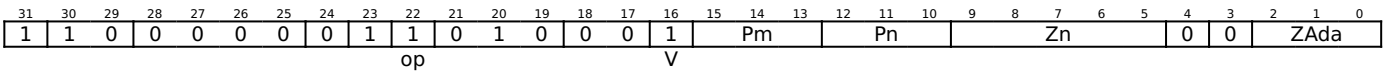
```
ADDVA <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let da : integer = UInt(ZAda);
```

64-bit

(FEAT_SME_I16I64)



Encoding

```
ADDVA <ZAda>.D, <Pn>/M, <Pm>/M, <Zn>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_I16I64) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let da : integer = UInt(ZAda);
```

Assembler Symbols

<ZAda>	For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field. For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7, encoded in the "ZAda" field.
<Pn>	Is the name of the first governing scalable predicate register P0-P7, encoded in the "Pn" field.
<Pm>	Is the name of the second governing scalable predicate register P0-P7, encoded in the "Pm" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer{} = VL DIV esize;
let mask1 : bits(PL) = P{PL}(a);
let mask2 : bits(PL) = P{PL}(b);
let operand_src : bits(VL) = Z{VL}(n);
let operand_acc : bits(dim*dim*esize) = ZAtile{dim*dim*esize}(da, esize);
var result : bits(dim*dim*esize);

for row = 0 to dim-1 do
    let element : bits(esize) = operand_src[row*:esize];
    for col = 0 to dim-1 do
        var res : bits(esize) = operand_acc[(row*dim+col)*:esize];
        if (ActivePredicateElement{PL}(mask1, row, esize) &&
              ActivePredicateElement{PL}(mask2, col, esize)) then
            res = res + element;
        end;
        result[(row*dim+col)*:esize] = res;
    end;
end;

ZAtile{dim*dim*esize}(da, esize) = result;
```

Operational information

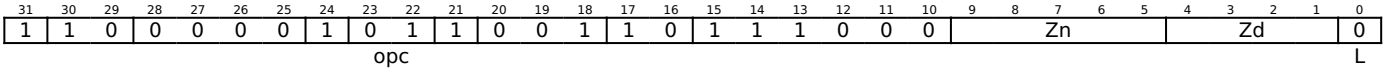
BF1CVT, BF2CVT

Multi-vector 8-bit floating-point convert to BFloat16

This instruction converts each 8-bit floating-point element of the source vector to BFloat16 while downscaling the value, and places the results in the corresponding 16-bit elements of the destination vectors. BF1CVT scales the values by $2^{-UInt(FPMR.LSCALE[5:0])}$. BF2CVT scales the values by $2^{-UInt(FPMR.LSCALE2[5:0])}$. The 8-bit floating-point encoding format for BF1CVT is selected by FPMR.F8S1. The 8-bit floating-point encoding format for BF2CVT is selected by FPMR.F8S2.
This instruction is unpredicated.
It has encodings from 2 classes: BF1CVT and BF2CVT

BF1CVT

(FEAT_SME2 && FEAT_FP8)



Encoding

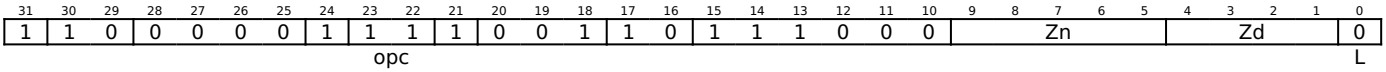
```
BF1CVT { <Zd1>.H-<Zd2>.H }, <Zn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let issrc2 : boolean = FALSE;
```

BF2CVT

(FEAT_SME2 && FEAT_FP8)



Encoding

```
BF2CVT { <Zd1>.H-<Zd2>.H }, <Zn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let issrc2 : boolean = TRUE;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckFPMREnabled();
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 8;
let operand : bits(VL) = Z{VL}(n);
var result : bits(2*VL);

for e = 0 to elements-1 do
    let element : bits(8) = operand[e*:8];
    result[e*:16] = FP8ConvertBF(element, issrc2, FPCR(), FPMR());
end;

Z{VL}(d+0) = result[VL-1:0];
Z{VL}(d+1) = result[2*VL-1:VL];
```

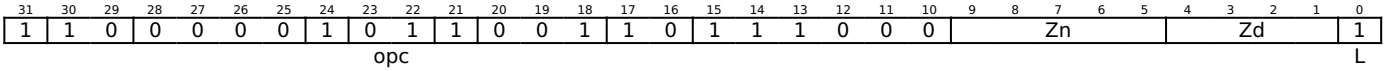
BF1CVTL, BF2CVTL

Multi-vector 8-bit floating-point convert to deinterleaved BFloat16

This instruction converts each 8-bit floating-point element of the source vector to BFloat16 while downscaling the value, and places the two-way deinterleaved results in the corresponding 16-bit elements of the destination vectors. BF1CVTL scales the values by $2^{-UInt(FPMR.LSCALE[5:0])}$. BF2CVTL scales the values by $2^{-UInt(FPMR.LSCALE2[5:0])}$. The 8-bit floating-point encoding format for BF1CVTL is selected by FPMR.F8S1. The 8-bit floating-point encoding format for BF2CVTL is selected by FPMR.F8S2.
This instruction is unpredicated.
It has encodings from 2 classes: BF1CVTL and BF2CVTL

BF1CVTL

(FEAT_SME2 && FEAT_FP8)



Encoding

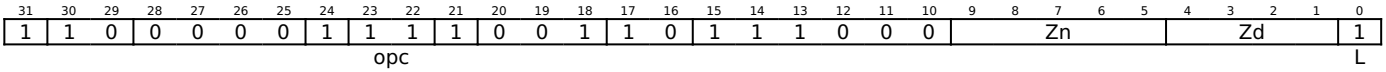
```
BF1CVTL { <Zd1>.H-<Zd2>.H }, <Zn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let issrc2 : boolean = FALSE;
```

BF2CVTL

(FEAT_SME2 && FEAT_FP8)



Encoding

```
BF2CVTL { <Zd1>.H-<Zd2>.H }, <Zn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd::'0');
let issrc2 : boolean = TRUE;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckFPMREnabled();
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV 16;
let operand : bits(VL) = Z{VL}(n);
var result1 : bits(VL);
var result2 : bits(VL);

for p = 0 to pairs-1 do
    let element1 : bits(8) = operand[(2*p + 0)*:8];
    let element2 : bits(8) = operand[(2*p + 1)*:8];
    result1[p*:16] = FP8ConvertBF(element1, issrc2, FPCR(), FPMR());
    result2[p*:16] = FP8ConvertBF(element2, issrc2, FPCR(), FPMR());
end;

Z{VL}(d+0) = result1;
Z{VL}(d+1) = result2;
```

BFADD

Multi-vector BFloat16 accumulate to ZA array vectors

This instruction destructively adds all elements of the two or four source vectors to the corresponding BFloat16 elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

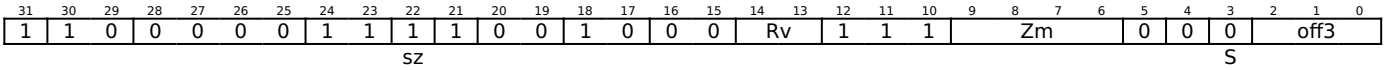
This instruction is unpredicated.

ID_AA64SMFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_B16B16)



Encoding

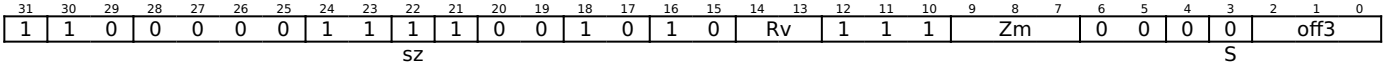
```
BFADD ZA.H[<Wv>, <offs>{, VGx2}], { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let m : integer{} = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME_B16B16)



Encoding

```
BFADD ZA.H[<Wv>, <offs>{, VGx4}], { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let m : integer{} = UInt(Zm::'00');
let offset : integer = UInt(off3);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zm1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zm4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = ZAvector{VL}(vec);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(16) = operand1[e*:16];
        let element2 : bits(16) = operand2[e*:16];
        result[e*:16] = BFAdd_ZA(element1, element2, FPCR());
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

BFCLAMP

Multi-vector BFloat16 clamp to minimum/maximum number

This instruction clamps each BFloat16 element in the two or four destination vectors to between the BFloat16 minimum value in the corresponding element of the first source vector and the BFloat16 maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the two or four destination vectors.

The behavior is as follows for each minimum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

This instruction follows SME2 non-widening BFloat16 numerical behaviors corresponding to instructions that place their results in two or four SVE Z vectors.

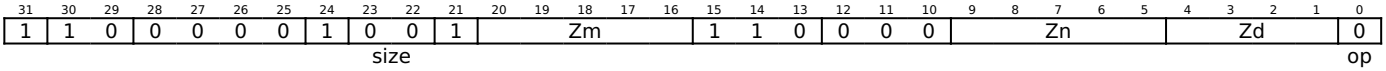
This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_SVE_B16B16)



Encoding

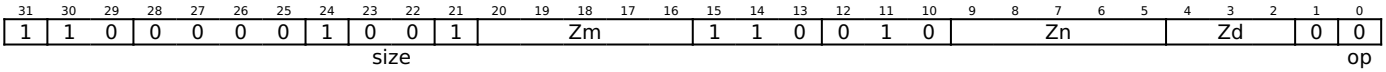
```
BFCLAMP { <Zd1>.H-<Zd2>.H }, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_B16B16) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2 && FEAT_SVE_B16B16)



Encoding

```
BFCLAMP { <Zd1>.H-<Zd4>.H }, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_B16B16) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = Z{VL}(d+r);
    for e = 0 to elements-1 do
        let element1 : bits(16) = operand1[e*:16];
        let element2 : bits(16) = operand2[e*:16];
        let element3 : bits(16) = operand3[e*:16];
        let maxelement : bits(16) = BFMaxNum{16}(element1, element3, FPCR());
        results[[r]][e*:16] = BFMinNum{16}(maxelement, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

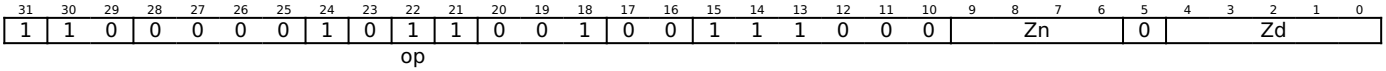
BFCVT (BFloat16 to 8-bit floating-point)

Multi-vector BFloat16 convert to 8-bit floating-point

This instruction converts each BFloat16 element of the two source vectors to 8-bit floating-point while scaling the value by $2^{SInt(FPMR.NSCALE)}$, and places the results in the half-width elements of the destination vector. The 8-bit floating-point encoding format is selected by FPMR.F8D.
This instruction is unpredicated.

SME2

(FEAT_SME2 && FEAT_FP8)



Encoding

```
BFCVT <Zd>.B, { <Zn1>.H-<Zn2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckFPMREnabled();
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var result : bits(VL);

let operand1 : bits(VL) = Z{VL}(n+0);
let operand2 : bits(VL) = Z{VL}(n+1);
for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    let element2 : bits(16) = operand2[e*:16];
    result[(0*elements + e)*:8] = BFConvertFP8(element1, FPCR(), FPMR());
    result[(1*elements + e)*:8] = BFConvertFP8(element2, FPCR(), FPMR());
end;
Z{VL}(d) = result;
```

BFCVT (single-precision to BFloat16)

Multi-vector single-precision convert to BFloat16

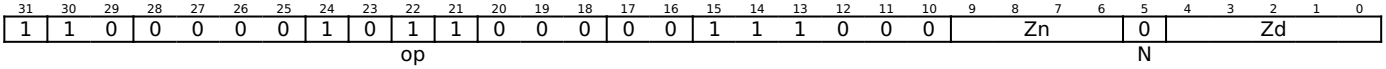
This instruction converts each element of the two source vectors from single-precision to BFloat16 floating-point, and places the results in the half-width destination elements.

This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
BFCVT <Zd>.H, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
var result : bits(VL);

let operand1 : bits(VL) = Z{VL}(n+0);
let operand2 : bits(VL) = Z{VL}(n+1);
for e = 0 to elements-1 do
    let element1 : bits(32) = operand1[e*:32];
    let element2 : bits(32) = operand2[e*:32];
    let res1 : bits(16) = FPConvertBF(element1, FPCR());
    let res2 : bits(16) = FPConvertBF(element2, FPCR());
    result[e*:16] = res1;
    result[(elements+e)*:16] = res2;
end;
Z{VL}(d) = result;
```

BFCVTN

Multi-vector single-precision convert to interleaved BFloat16

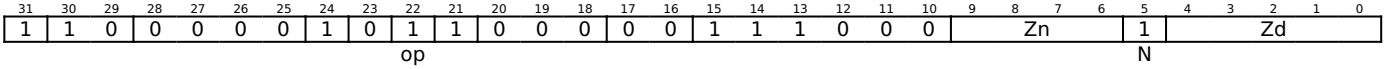
This instruction converts each element of the two source vectors from single-precision to BFloat16 floating-point, and places the two-way interleaved results in the half-width destination elements.

This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
BFCVTN <Zd>.H, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
var result : bits(VL);

let operand1 : bits(VL) = Z{VL}(n+0);
let operand2 : bits(VL) = Z{VL}(n+1);
for e = 0 to elements-1 do
    let element1 : bits(32) = operand1[e*:32];
    let element2 : bits(32) = operand2[e*:32];
    let res1 : bits(16) = FPConvertBF(element1, FPCR());
    let res2 : bits(16) = FPConvertBF(element2, FPCR());
    result[(2*e + 0)*:16] = res1;
    result[(2*e + 1)*:16] = res2;
end;
Z{VL}(d) = result;
```

BFDOT (multiple and indexed vector)

Multi-vector BFloat16 dot product by indexed element to single-precision

This instruction calculates the dot product of a pair of BFloat16 values held in the corresponding 32-bit elements of the two or four first source vectors and the indexed 32-bit element of the second source vector. The single-precision dot product results are destructively added to the corresponding single-precision elements of the ZA single-vector groups.

The BFloat16 pairs within the second source vector are specified using an immediate index that selects the same BFloat16 pair position within each 128-bit vector segment. The element index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

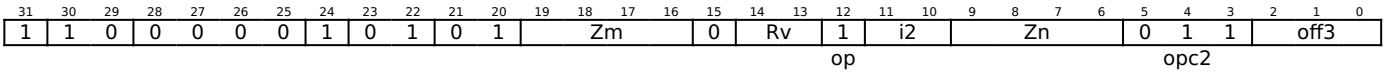
This instruction follows SME2 ZA-targeting BFloat16 numerical behaviors.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

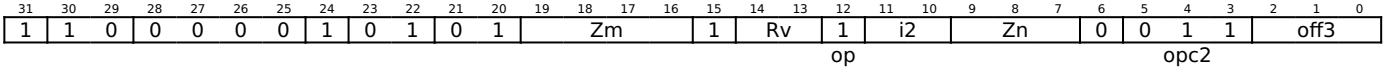
```
BFDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 2;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
BFDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 4;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<index> Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let segmentsize : integer{} = 128;
let eltspersegment : integer = segmentsize DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let elt1_a : bits(hsize) = operand1[(2 * e + 0)*:hsize];
        let elt1_b : bits(hsize) = operand1[(2 * e + 1)*:hsize];
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        let elt2_a : bits(hsize) = operand2[(2 * s + 0)*:hsize];
        let elt2_b : bits(hsize) = operand2[(2 * s + 1)*:hsize];
        var sum : bits(esize) = operand3[e*:esize];
        sum = BFDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

BFMAX (multiple and single vector)

Multi-vector BFloat16 maximum by vector

This instruction determines the maximum of BFloat16 elements of the second source vector and the corresponding BFloat16 elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

This instruction follows SME2 non-widening BFloat16 numerical behaviors corresponding to instructions that place their results in two or four SVE Z vectors.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_SVE_B16B16)

BFMAXNM (multiple and single vector)

Multi-vector BFloat16 maximum number by vector

This instruction determines the maximum number value of BFloat16 elements of the second source vector and the corresponding BFloat16 elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction follows SME2 non-widening BFloat16 numerical behaviors corresponding to instructions that place their results in two or four SVE Z vectors.

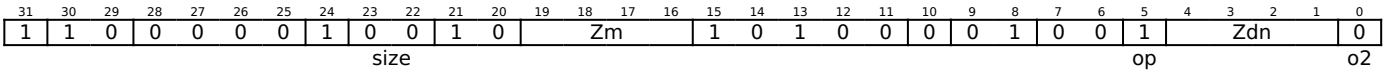
This instruction is unpredicated.

ID_AA64ZFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_SVE_B16B16)



Encoding

```
BFMAXNM { <Zdn1>.H-<Zdn2>.H }, { <Zdn1>.H-<Zdn2>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_B16B16) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

Encoding

```
BFMAXNM { <Zdn1>.H-<Zdn4>.H }, { <Zdn1>.H-<Zdn4>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_B16B16) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.
<Zdn2>	Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let element1 : bits(16) = operand1[e*:16];
        let element2 : bits(16) = operand2[e*:16];
        results[[r]][e*:16] = BFMaxNum{16}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

BFMAXNM (multiple vectors)

Multi-vector BFloat16 maximum number

This instruction determines the maximum number value of BFloat16 elements of the two or four second source vectors and the corresponding BFloat16 elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

This instruction follows SME2 non-widening BFloat16 numerical behaviors corresponding to instructions that place their results in two or four SVE Z vectors.

This instruction is unpredicated.

BFMLA (multiple and indexed vector)

Multi-vector BFloat16 fused multiply-add by indexed element

This instruction multiplies the indexed element of the second source vector by the corresponding BFloat16 elements of the two or four first source vectors and destructively adds these values without intermediate rounding to the corresponding elements of the ZA single-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 16;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i3h::i3l);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let segmentsize : integer{} = 128;
let eltspersegment : integer = segmentsize DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let op1 : bits(VL) = Z{VL}(n+r);
    let op2 : bits(VL) = Z{VL}(m);
    let op3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let elem1 : bits(esize) = op1[e*:esize];
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        let elem2 : bits(esize) = op2[s*:esize];
        let elem3 : bits(esize) = op3[e*:esize];
        result[e*:esize] = BFMulAdd_ZA(elem3, elem1, elem2, FPCR());
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

BFMLA (multiple and single vector)

Multi-vector BFloat16 fused multiply-add by vector

This instruction multiplies the corresponding BFloat16 elements of the two or four first source vector with the corresponding elements of the second source vector and destructively adds these values without intermediate rounding to the corresponding elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

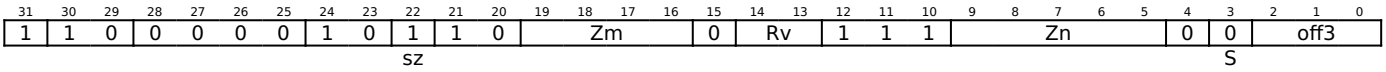
This instruction is unpredicated.

ID_AA64SMFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_B16B16)



Encoding

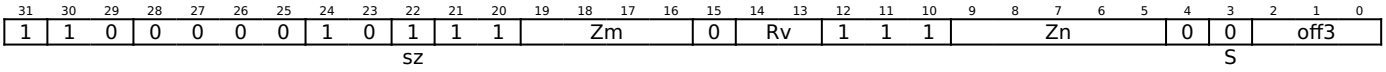
```
BFMLA ZA.H[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME_B16B16)



Encoding

```
BFMLA ZA.H[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 16;
let n : integer = UInt(Zn);

BFMLAL (multiple and indexed vector)

Multi-vector BFloat16 multiply-add by indexed element to single-precision

This instruction widens all 16-bit BFloat16 elements in the one, two, or four first source vectors and the indexed element of the second source vector to single-precision format, then multiplies the corresponding elements and destructively adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the ZA double-vector groups.

The BFloat16 elements within the second source vector are specified using a 3-bit immediate index that selects the same element position within each 128-bit vector segment.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

BFMLS (multiple and indexed vector)

Multi-vector BFloat16 fused multiply-subtract by indexed element

This instruction multiplies the indexed element of the second source vector by the corresponding BFloat16 elements of the two or four first source vectors and destructively subtracts these values without intermediate rounding from the corresponding elements of the ZA single-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

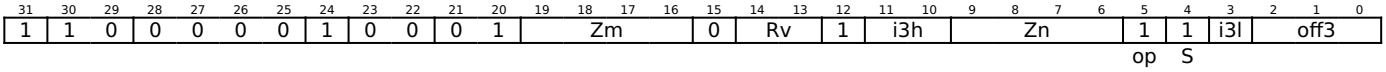
This instruction is unpredicated.

ID_AA64SMFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_B16B16)



Encoding

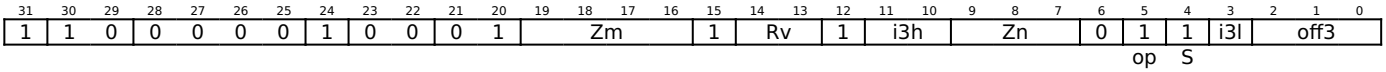
```
BFMLS ZA.H[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i3h::i3l);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME_B16B16)



Encoding

```
BFMLS ZA.H[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```

BFMLSL (multiple vectors)

Multi-vector BFloat16 multiply-subtract from single-precision

This instruction widens all 16-bit BFloat16 elements in the two or four first and second source vectors to single-precision format, then multiplies the corresponding elements and destructively subtracts these values without intermediate rounding from the overlapping 32-bit single-precision elements of the ZA double-vector groups.

The double-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

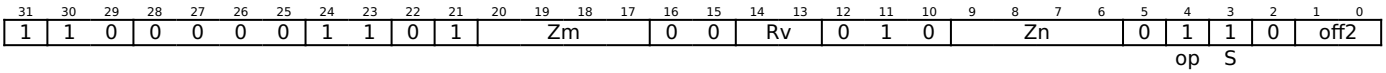
This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA double-vectors and Four ZA double-vectors

Two ZA double-vectors

(FEAT_SME2)



Encoding

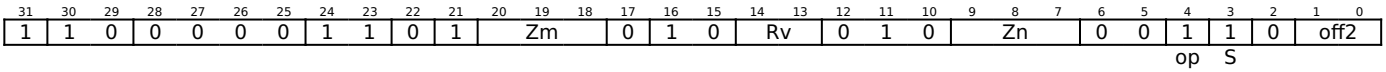
```
BFMLSL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 2;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Four ZA double-vectors

(FEAT_SME2)



Encoding

```
BFMLSL ZA.S[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 4;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	Is the first vector select offset, encoded as "off2" field times 2.
<offs2>	Is the second vector select offset, encoded as "off2" field times 2 plus 1.
<Zn1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

	For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.
<Zm4>	Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();

BFMOP4A (non-widening)

BFloat16 quarter-tile outer product, accumulating

This instruction generates four independent quarter-tile BFloat16 outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 16-bit element ZA tile.
Each of the quarter-tile outer products is generated by multiplying the $SVL_H \div 2 \times 1$ sub-matrix of BFloat16 values held in the half-vectors of the first source vectors by the $1 \times SVL_H \div 2$ sub-matrix of BFloat16 values held in the half-vectors of the second source vectors.

The resulting quarter-tile $SVL_H \div 2 \times SVL_H \div 2$ BFloat16 outer products are destructively added to the destination ZA tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.
This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.
This instruction is unpredicated.
It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

BFMOP4A (widening)

BFloat16 quarter-tile sum of outer products to single-precision, accumulating

This instruction generates four independent quarter-tile BFloat16 sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of BFloat16 values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of BFloat16 values held in the half-vectors of the second source vectors. Each 32-bit container of the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vectors holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix.

The instruction widens the sub-matrices of BFloat16 values held in the first source vectors to single-precision values and multiplies them by the corresponding widened sub-matrices of BFloat16 values in the second source vectors to single-precision values. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ single-precision sums of outer products are then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.

This instruction follows SME BFloat16 numerical behaviors.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

BFMOP4S (widening)

BFloat16 quarter-tile sum of outer products to single-precision, subtracting

This instruction generates four independent quarter-tile BFloat16 sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of BFloat16 values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of BFloat16 values held in the half-vectors of the second source vectors. Each 32-bit container of the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vectors holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix.

The instruction widens the sub-matrices of BFloat16 values held in the first source vectors to single-precision values and multiplies them by the corresponding widened sub-matrices of BFloat16 values in the second source vectors to single-precision values. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ single-precision sums of outer products are then destructively subtracted from the single-precision destination tile. This is equivalent to performing a 2-way dot product and subtract from each of the destination tile elements.

This instruction follows SME BFloat16 numerical behaviors.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

Single and multiple vectors

BFMOPA (widening)

BFloat16 sum of outer products to single-precision, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction multiplies the $SVL_S \times 2$ sub-matrix of BFloat16 values held in the first source vector by the $2 \times SVL_S$ sub-matrix of BFloat16 values in the second source vector.
Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is Inactive it is treated as having the value +0.0, but if both pairs of source vector elements that correspond to a 32-bit destination element contain Inactive elements, then the destination element remains unmodified.
The resulting $SVL_S \times SVL_S$ single-precision sum of outer products is then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

This instruction follows SME BFloat16 numerical behaviors.

BFMUL (multiple vectors)

Multi-vector BFloat16 multiply

This instruction multiplies all the BFloat16 elements of the two or four first source vectors by the corresponding BFloat16 elements of the two or four second source vectors, and places the results in the corresponding elements of the two or four destination vectors.

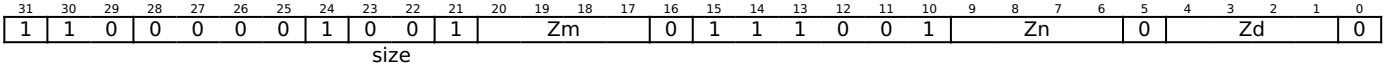
This instruction follows SME2 non-widening BFloat16 numerical behaviors corresponding to instructions that place their results in two or four SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_SVE_BFSCALE)



Encoding

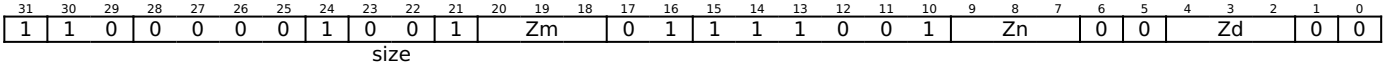
```
BFMUL { <Zd1>.H-<Zd2>.H }, { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_BFSCALE) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2 && FEAT_SVE_BFSCALE)



Encoding

```
BFMUL { <Zd1>.H-<Zd4>.H }, { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_SVE_BFSCALE) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

BFSUB

Multi-vector BFloat16 subtract from ZA array vectors

This instruction destructively subtracts all elements of the two or four source vectors from the corresponding BFloat16 elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

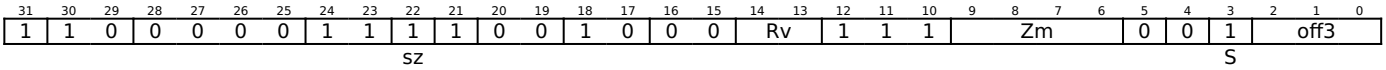
This instruction is unpredicated.

ID_AA64SMFR0_EL1.B16B16 indicates whether this instruction is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_B16B16)



Encoding

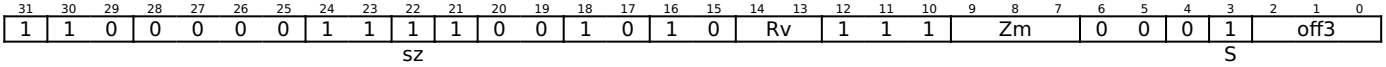
```
BFSUB ZA.H[<Wv>, <offs>{, VGx2}], { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let m : integer{} = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME_B16B16)



Encoding

```
BFSUB ZA.H[<Wv>, <offs>{, VGx4}], { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_B16B16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let m : integer{} = UInt(Zm::'00');
let offset : integer = UInt(off3);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zm1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zm4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = ZAvector{VL}(vec);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(16) = operand1[e*:16];
        let element2 : bits(16) = operand2[e*:16];
        result[e*:16] = BFSub_ZA(element1, element2, FPCR());
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

BFTMOPA (non-widening)

BFloat16 sparse outer product, accumulating

This instruction generates BFloat16 outer product by multiplying the 1-in-2 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the destination ZA tile elements.

The outer product is generated by multiplying the selected 1-in-2 BFloat16 value from each overlapping 16-bit containers of the two $SVL_H \times 1$ sub-matrices in the first source vectors by the BFloat16 value from the corresponding 16-bit container of the compressed $1 \times SVL_H$ sub-matrix in the second source vector.

The 1-in-2 BFloat16 value in the first source vectors is selected by 2-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the result. If both bits of the 2-bit control corresponding to the elements of the first source vectors are 1, only the element corresponding to the least significant bit is selected.

The instruction multiplies the selected elements of sub-matrices of BFloat16 values held in the first source vectors by the corresponding elements of sub-matrix of BFloat16 values in the second source vector. The resulting BFloat16 $SVL_H \times SVL_H$ outer product is then destructively added to the BFloat16 destination tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.

This instruction follows SME2 ZA-targeting non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

SME2

(FEAT_SME_TMOP && FEAT_SME_B16B16)

Encoding

```
BFTMOPA <ZAda>.H, { <Zn1>.H-<Zn2>.H }, <Zm>.H, <Zk>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_TMOP) || !IsFeatureImplemented(FEAT_SME_B16B16) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm);
let k : integer = UInt('1'::K::'1'::Zk);
let index : integer = UInt(i2);
let da : integer = UInt(ZAda);
```

Assembler Symbols

<ZAda>	Is the name of the ZA tile ZA0-ZA1, encoded in the "ZAda" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the control vector register Z20-Z23 or Z28-Z31, encoded as "'1':K:'1':Zk".
<index>	Is the control segment index, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let dim : integer{} = VL DIV 16;
let csize : integer{} = VL DIV 8;
let op2 : bits(VL) = Z{}(m);
let op3 : bits(VL) = Z{}(k);
let ctrl : bits(csize) = op3[index*:csize];
let op4 : bits(dim*dim*16) = ZAtile{dim*dim*16}(da, 16);
var result : bits(dim*dim*16);

for row = 0 to dim-1 do
    for col = 0 to dim-1 do
        var i : integer = 0;
        var elem1 : bits(16) = BFZero{16}('0');
        for r = 0 to 1 do
            let op1 : bits(VL) = Z{}(n+r);

BFTMOPA (widening)

BFloat16 sparse sum of outer products to single-precision, accumulating

This instruction generates BFloat16 sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected 2-in-4 BFloat16 values from each overlapping 32-bit containers of the two $SVL_S \times 2$ sub-matrices in the first source vectors by the two BFloat16 values from the corresponding 32-bit container of the $2 \times SVL_S$ sub-matrix in the second source vector. The two selected elements from each overlapping 32-bit containers of the first source vectors correspond to 2-in-4 elements of rows of two $SVL_S \times 2$ sub-matrices. Each 32-bit container of the second source vector holds 2 elements of columns of a compressed $2 \times SVL_S$ sub-matrix.

The 2-in-4 BFloat16 values from overlapping 32-bit containers of the first source vectors are selected by 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to 32-bit containers of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The instruction widens the selected elements of sub-matrices of BFloat16 values held in the first source vectors to single-precision values and multiplies them by the corresponding widened elements of sub-matrix of BFloat16 values in the second source vector to single-precision values. The resulting $SVL_S \times SVL_S$ single-precision sum of outer products is then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.

This instruction follows SME BFloat16 numerical behaviors.

This instruction is unpredicated.

BFVDOT

Multi-vector BFloat16 vertical dot product by indexed element to single-precision

This instruction calculates the sum-of-products of each vertical pair of BFloat16 values in the corresponding elements of the two first source vectors with the pair of BFloat16 values in the indexed 32-bit group of the corresponding 128-bit segment of the second source vector. The single-precision sum-of-products are destructively added to the corresponding single-precision elements of the two ZA single-vector groups.

The BFloat16 pairs within the second source vector are specified using an immediate index that selects the same BFloat16 pair position within each 128-bit vector segment. The element index range is from 0 to 3.

The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

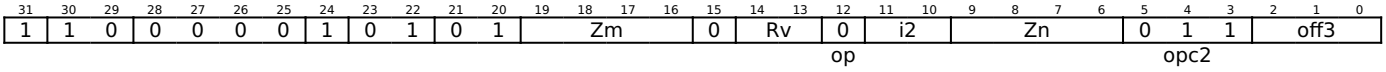
The vector group symbol VGx2 indicates that the ZA operand consists of two ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME2 ZA-targeting BFloat16 numerical behaviors.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
BFVDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV 2;
let segmentsize : integer{} = 128;
let eltspersegment : integer = segmentsize DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to 1 do
    let operand1a : bits(VL) = Z{VL}(n);
    let operand1b : bits(VL) = Z{VL}(n+1);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let segmentbase : integer = e - e MOD eltspersegment;
        let s : integer = segmentbase + index;
        let elt1_a : bits(hsize) = operand1a[(2 * e + r)*:hsize];
        let elt1_b : bits(hsize) = operand1b[(2 * e + r)*:hsize];
        let elt2_a : bits(hsize) = operand2[(2 * s + 0)*:hsize];
        let elt2_b : bits(hsize) = operand2[(2 * s + 1)*:hsize];
        var sum : bits(esize) = operand3[e*:esize];
        sum = BFDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

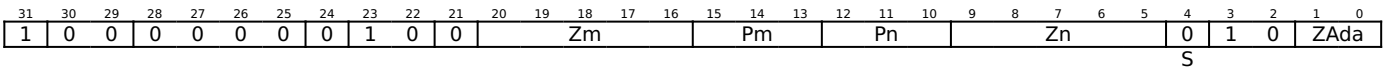
BMOPA

Bitwise exclusive NOR population count outer product, accumulating

This instruction works with 32-bit element ZA tile. This instruction generates an outer product of the first source $SVL_S \times 1$ vector and the second source $1 \times SVL_S$ vector. Each outer product element is obtained as population count of the bitwise XNOR result of the corresponding 32-bit elements of the first source vector and the second source vector. Each source vector is independently predicated by a corresponding governing predicate. When either source vector element is inactive the corresponding destination tile element remains unmodified. The resulting $SVL_S \times SVL_S$ product is then destructively added to the destination tile.

SME2

(FEAT_SME2)



Encoding

```
BMOPA <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.S, <Zm>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(ZAda);
```

Assembler Symbols

<ZAda>	Is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field.
<Pn>	Is the name of the first governing scalable predicate register P0-P7, encoded in the "Pn" field.
<Pm>	Is the name of the second governing scalable predicate register P0-P7, encoded in the "Pm" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer{} = VL DIV esize;
let mask1 : bits(PL) = P{PL}(a);
let mask2 : bits(PL) = P{PL}(b);
let operand1 : bits(VL) = Z{VL}(n);
let operand2 : bits(VL) = Z{VL}(m);
let operand3 : bits(dim*dim*esize) = ZAtile{dim*dim*esize}(da, esize);
var result : bits(dim*dim*esize);

for row = 0 to dim-1 do
    let element1 : bits(esize) = operand1[row*:esize];
    for col = 0 to dim-1 do
        let element2 : bits(esize) = operand2[col*:esize];
        let element3 : bits(esize) = operand3[(row*dim + col)*:esize];
        if (ActivePredicateElement{PL}(mask1, row, esize) &&
              ActivePredicateElement{PL}(mask2, col, esize)) then
            let res : integer = BitCount(NOT(element1 XOR element2));
            result[(row*dim + col)*:esize] = element3 + res;
        else
            result[(row*dim + col)*:esize] = element3;
        end;
    end;
end;
ZAtile{dim*dim*esize}(da, esize) = result;
```

Operational information

FADD

Multi-vector floating-point accumulate to ZA array vectors

This instruction destructively adds all elements of the two or four source vectors to the corresponding elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

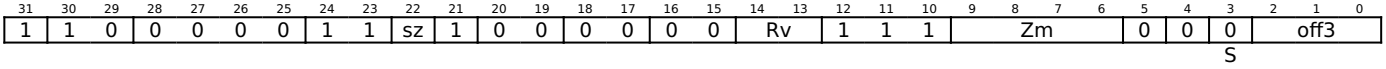
This instruction is unpredicated.

ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented, and ID_AA64SMFR0_EL1.F16F16 indicates whether the half-precision variant is implemented.

It has encodings from 4 classes: Two ZA single-vectors , Two ZA single-vectors of half-precision elements , Four ZA single-vectors and Four ZA single-vectors of half-precision elements

Two ZA single-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_F64F64))



Encoding

```
FADD ZA.<T>[<Wv>, <offs>{, VGx2}], { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;

```

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.

<offs> Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

<Zm1> For the "Two ZA single-vectors of half-precision elements" and "Two ZA single-vectors" variants: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 2.

For the "Four ZA single-vectors of half-precision elements" and "Four ZA single-vectors" variants: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zm4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = ZAvector{VL}(vec);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPAdd_ZA{esize}(element1, element2, FPCR());
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

FAMAX

Multi-vector floating-point absolute maximum

This instruction determines the maximum absolute value from floating-point elements of the two or four second source vectors and the corresponding floating-point elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

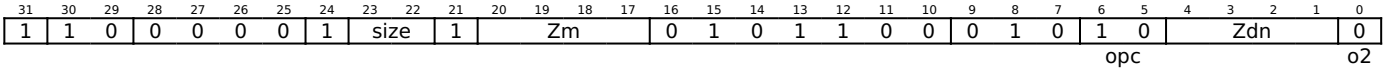
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_FAMINMAX)



Encoding

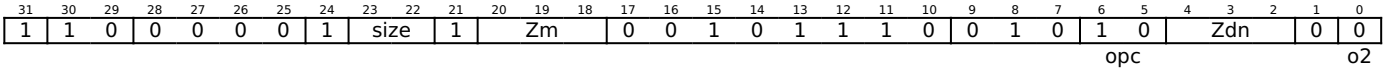
```
FAMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FAMINMAX) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2 && FEAT_FAMINMAX)



Encoding

```
FAMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FAMINMAX) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm1> For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        results[[r]][e*:esize] = FPAbsMax{esize}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

FAMIN

Multi-vector floating-point absolute minimum

This instruction determines the minimum absolute value from floating-point elements of the two or four second source vectors and the corresponding floating-point elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

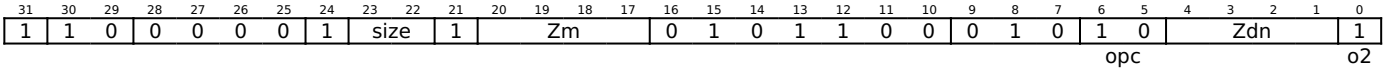
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 && FEAT_FAMINMAX)



Encoding

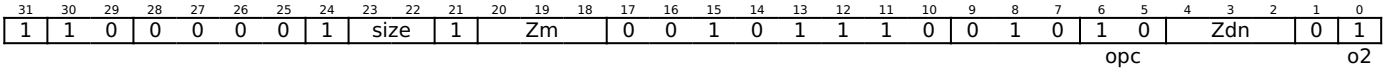
```
FAMIN { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FAMINMAX) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2 && FEAT_FAMINMAX)



Encoding

```
FAMIN { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FAMINMAX) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm1> For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        results[[r]][e*:esize] = FPAbsMin{esize}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

FCLAMP

Multi-vector floating-point clamp to minimum/maximum number

This instruction clamps each floating-point element in the two or four destination vectors to between the floating-point minimum value in the corresponding element of the first source vector and the floating-point maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the two or four destination vectors.

The behavior is as follows for each minimum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

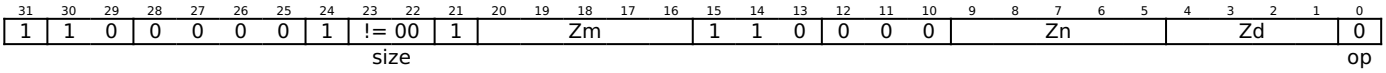
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

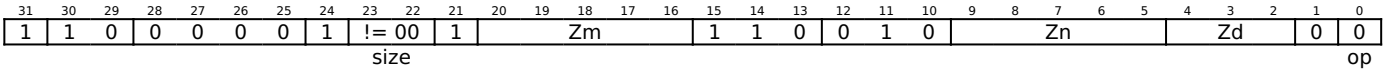
```
FCLAMP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
FCLAMP { <Zd1>.<T>-<Zd4>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = Z{VL}(d+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        let element3 : bits(esize) = operand3[e*:esize];
        let maxelement : bits(esize) = FPMaxNum{esize}(element1, element3, FPCR());
        results[[r]][e*:esize] = FPMinNum{esize}(maxelement, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

FCVT (narrowing, FP16 to FP8)

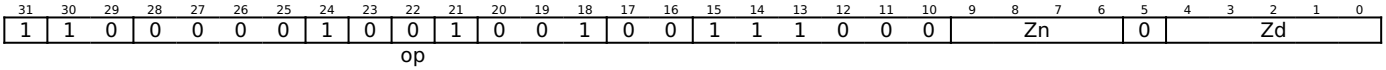
Multi-vector half-precision convert to 8-bit floating-point

This instruction converts each half-precision element of the two source vectors to 8-bit floating-point while scaling the value by $2^{\text{SInt(FPMR.NSCALE[4:0])}}$, and places the results in the half-width elements of the destination vector. The 8-bit floating-point encoding format is selected by FPMR.F8D.

This instruction is unpredicated.

SME2

(FEAT_SME2 && FEAT_FP8)



Encoding

```
FCVT <Zd>.B, { <Zn1>.H-<Zn2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !IsFeatureImplemented(FEAT_FP8) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckFPMREnabled();
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 16;
var result : bits(VL);

let operand1 : bits(VL) = Z{VL}(n+0);
let operand2 : bits(VL) = Z{VL}(n+1);
for e = 0 to elements-1 do
    let element1 : bits(16) = operand1[e*:16];
    let element2 : bits(16) = operand2[e*:16];
    result[(0*elements + e)*:8] = FPConvertFP8{8, 16}(element1, FPCR(), FPMR());
    result[(1*elements + e)*:8] = FPConvertFP8{8, 16}(element2, FPCR(), FPMR());
end;
Z{VL}(d) = result;
```

FCVTZS

Multi-vector single-precision convert to signed 32-bit integer, rounding toward zero

This instruction converts each element of the two or four source vectors from single-precision to the signed 32-bit integer nearer to zero, and places the results in the corresponding elements of the two or four destination vectors.

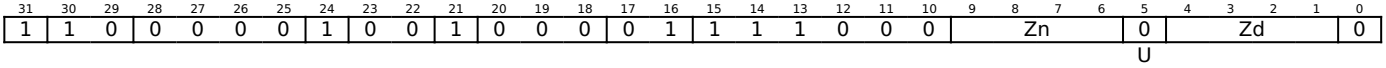
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

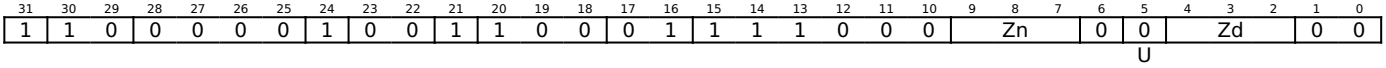
```
FCVTZS { <Zd1>.S-<Zd2>.S }, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
let unsigned : boolean = FALSE;
let rounding : FPRounding = FPRounding_ZERO;
```

Four registers

(FEAT_SME2)



Encoding

```
FCVTZS { <Zd1>.S-<Zd4>.S }, { <Zn1>.S-<Zn4>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
let unsigned : boolean = FALSE;
let rounding : FPRounding = FPRounding_ZERO;
```

Assembler Symbols

<Zd1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn1>	For the "Two registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Zn4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : bits(32) = operand[e*:32];
        results[[r]][e*:32] = FPToFixed{32, 32}(element, 0, unsigned, FPCR(), rounding);
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

FDOT (2-way, multiple and indexed vector, FP16 to FP32)

Multi-vector half-precision dot product by indexed element to single-precision

This instruction calculates the fused sum-of-products of a pair of half-precision values held in the corresponding 32-bit elements of the two or four first source vectors and the indexed 32-bit element of the second source vector, without intermediate rounding. The single-precision sum-of-products are destructively added to the corresponding single-precision elements of the ZA single-vector groups.

The half-precision pairs within the second source vector are specified using an immediate index that selects the same pair position within each 128-bit vector segment. The element index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

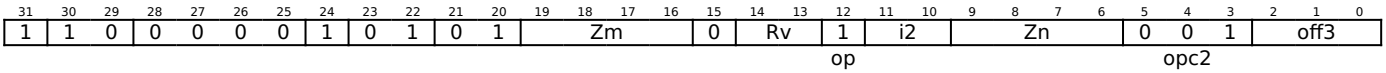
This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

```
FDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

FDOT (2-way, multiple and indexed vector, FP8 to FP16)

Multi-vector 8-bit floating-point dot product by indexed element to half-precision

This instruction calculates the fused sum-of-products of a pair of 8-bit floating-point values held in the corresponding 16-bit elements of the two or four first source vectors and the indexed 16-bit element of the second source vector. The half-precision sum-of-products are scaled by $2^{-UInt(FPMR.LSCALE[3:0])}$, before being destructively added without intermediate rounding to the corresponding half-precision elements of the ZA single-vector groups. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

The 8-bit floating-point pairs within the second source vector are specified using an immediate index that selects the same pair position within each 128-bit vector segment.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

Two ZA single-vectors

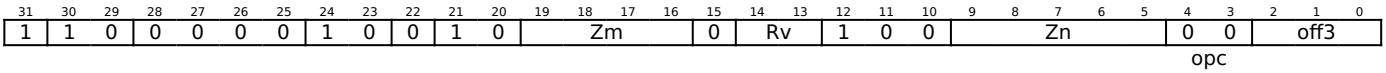
(FEAT_SME2)



Encoding

```
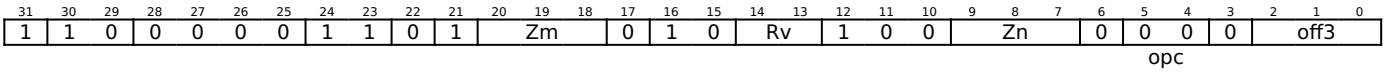
FDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
FDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(off3);
let nreg : integer{} = 4;
let esize : integer{} = 32;
let hsize : integer{} = esize DIV 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    let operand3 : bits(VL) = ZAvector{VL}(vec);
    for e = 0 to elements-1 do
        let elt1_a : bits(hsize) = operand1[(2 * e + 0)*:hsize];
        let elt1_b : bits(hsize) = operand1[(2 * e + 1)*:hsize];
        let elt2_a : bits(hsize) = operand2[(2 * e + 0)*:hsize];
        let elt2_b : bits(hsize) = operand2[(2 * e + 1)*:hsize];
        var sum : bits(esize) = operand3[e*:esize];
        sum = FPDotAdd_ZA(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
        result[e*:esize] = sum;
    end;
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

FDOT (2-way, multiple vectors, FP8 to FP16)

Multi-vector 8-bit floating-point dot product to half-precision

This instruction calculates the fused sum-of-products of a pair of 8-bit floating-point values held in the corresponding 16-bit elements of the two or four first and second source vectors. The half-precision sum-of-products are scaled by $2^{-UInt(FPMR.LSCALE[3:0])}$, before being destructively added without intermediate rounding to the corresponding half-precision elements of the ZA single-vector groups. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

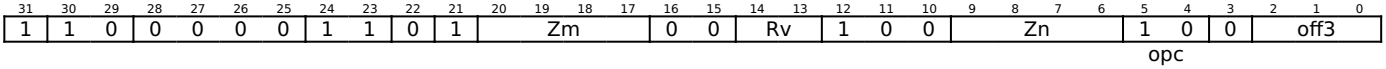
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_F8F16)



Encoding

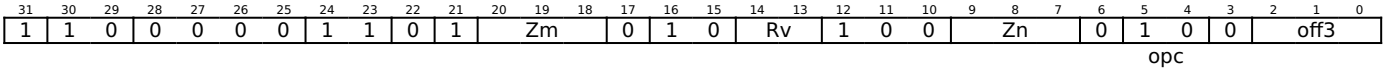
```
FDOT ZA.H[<Wv>, <offs>{, VGx2}], { <Zn1>.B-<Zn2>.B }, { <Zm1>.B-<Zm2>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_F8F16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME_F8F16)



Encoding

```
FDOT ZA.H[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, { <Zm1>.B-<Zm4>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_F8F16) then EndOfDecode(Decode_UNDEF); end;

FDOT (4-way, multiple and indexed vector)

Multi-vector 8-bit floating-point dot product by indexed element to single-precision

This instruction calculates the fused sum-of-products of a group of four 8-bit floating-point values held in the corresponding 32-bit elements of the two or four first source vectors and the indexed 32-bit element of the second source vector. The single-precision sum-of-products are scaled by $2^{-UInt(FPMR.LSCALE)}$, before being destructively added without intermediate rounding to the corresponding single-precision elements of the ZA single-vector groups. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

The 8-bit floating-point groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

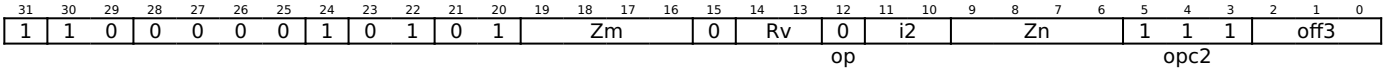
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME_F8F32)



Encoding

FMAX (multiple and single vector)

Multi-vector floating-point maximum by vector

This instruction determines the maximum of floating-point elements of the second source vector and the corresponding floating-point elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

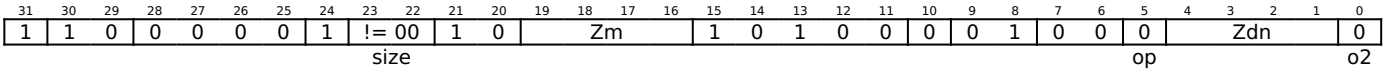
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

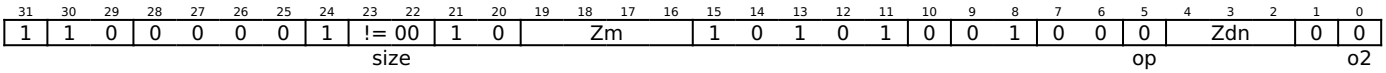
```
FMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
FMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

FMAX (multiple vectors)

Multi-vector floating-point maximum

This instruction determines the maximum of floating-point elements of the two or four second source vectors and the corresponding floating-point elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

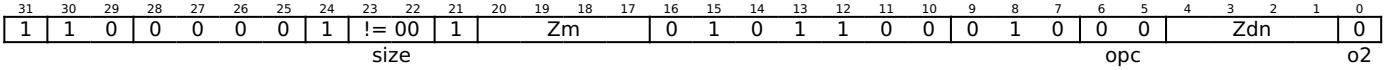
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

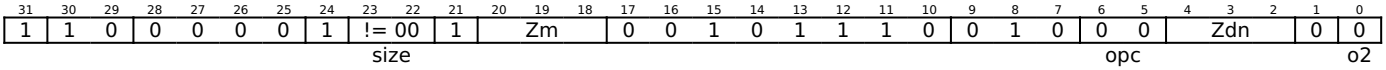
```
FMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
FMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm1> For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        results[[r]][e*:esize] = FPMax{esize}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

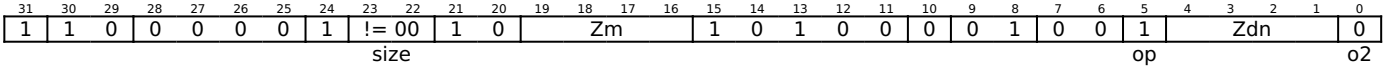
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

```
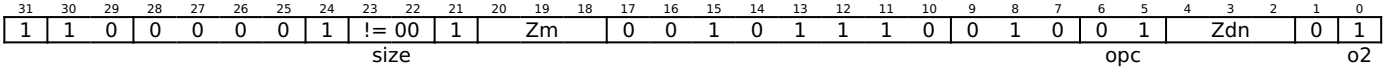
FMINNM { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
FMINNM { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt(Zm::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zdn2>	Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.
<Zm1>	For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zdn4>	Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.
<Zm4>	Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        results[[r]][e*:esize] = FPMinNum{esize}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

FMLA (multiple and indexed vector)

Multi-vector floating-point fused multiply-add by indexed element

This instruction multiplies the indexed element of the second source vector by the corresponding floating-point elements of the two or four first source vectors and destructively adds these values without intermediate rounding to the corresponding elements of the ZA single-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented, and ID_AA64SMFR0_EL1.F16F16 indicates whether the half-precision variant is implemented.

It has encodings from 6 classes: Two ZA single-vectors of half-precision elements , Two ZA single-vectors of single-precision elements , Two ZA single-vectors of double-precision elements , Four ZA single-vectors of half-precision elements , Four ZA single-vectors of single-precision elements and Four ZA single-vectors of double-precision elements

FMLAL (multiple and indexed vector, FP16 to FP32)

Multi-vector half-precision multiply-add by indexed element to single-precision

This instruction widens all 16-bit half-precision elements in the one, two, or four first source vectors and the indexed element of the second source vector to single-precision format, then multiplies the corresponding elements and destructively adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the ZA double-vector groups.

The half-precision elements within the second source vector are specified using a 3-bit immediate index that selects the same element position within each 128-bit vector segment.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

FMLAL (multiple and indexed vector, FP8 to FP16)

Multi-vector 8-bit floating-point multiply-add by indexed element to half-precision

This instruction widens all 8-bit floating-point elements in the one, two, or four first source vectors and the indexed element of the second source vector to half-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$ before being destructively added without intermediate rounding to the overlapping 16-bit half-precision elements of the ZA double-vector groups.

The 8-bit floating-point elements within the second source vector are specified using a 4-bit immediate index that selects the same element position within each 128-bit vector segment.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

FMLAL (multiple vectors, FP8 to FP16)

Multi-vector 8-bit floating-point multiply-add to half-precision

This instruction widens all 8-bit floating-point elements in the two or four first and second source vectors to half-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$ before being destructively added without intermediate rounding to the overlapping 16-bit half-precision elements of the ZA double-vector groups.

The double-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA double-vectors and Four ZA double-vectors

Two ZA double-vectors

(FEAT_SME_F8F16)

Encoding

```
FMLAL ZA.H[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.B-<Zn2>.B }, { <Zm1>.B-<Zm2>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_F8F16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 2;
```

Four ZA double-vectors

(FEAT_SME_F8F16)

Encoding

```
FMLAL ZA.H[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.B-<Zn4>.B }, { <Zm1>.B-<Zm4>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_F8F16) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	Is the first vector select offset, encoded as "off2" field times 2.
<offs2>	Is the second vector select offset, encoded as "off2" field times 2 plus 1.
<Zn1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. FMLS (multiple and indexed vector)

Multi-vector floating-point fused multiply-subtract by indexed element

This instruction multiplies the indexed element of the second source vector by the corresponding floating-point elements of the two or four first source vectors and destructively subtracts these values without intermediate rounding from the corresponding elements of the ZA single-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

FMLSL (multiple and indexed vector)

Multi-vector half-precision multiply-subtract by indexed element from single-precision

This instruction widens all 16-bit half-precision elements in the one, two, or four first source vectors and the indexed element of the second source vector to single-precision format, then multiplies the corresponding elements and destructively subtracts these values without intermediate rounding from the overlapping 32-bit single-precision elements of the ZA double-vector groups.

The half-precision elements within the second source vector are specified using a 3-bit immediate index that selects the same element position within each 128-bit vector segment.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2)

FMLSL (multiple and single vector)

Multi-vector half-precision multiply-subtract by vector from single-precision

This instruction widens all 16-bit half-precision elements in the one, two, or four first source vectors and the second source vector to single-precision format, then multiplies the corresponding elements and destructively subtracts these values without intermediate rounding from the overlapping 32-bit single-precision elements of the ZA double-vector groups.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

FMOP4A (non-widening)

Floating-point quarter-tile outer product, accumulating

This instruction generates four independent quarter-tile floating-point outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 16-bit, 32-bit, or 64-bit element ZA tile.

In case of the half-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_H \div 2 \times 1$ sub-matrix of half-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_H \div 2$ sub-matrix of half-precision values held in the half-vectors of the second source vectors. In case of the single-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_S \div 2 \times 1$ sub-matrix of single-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_S \div 2$ sub-matrix of single-precision values held in the half-vectors of the second source vectors. In case of the double-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_D \div 2 \times 1$ sub-matrix of double-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_D \div 2$ sub-matrix of double-precision values held in the half-vectors of the second source vectors.

The resulting quarter-tile $SVL_H \div 2 \times SVL_H \div 2$ half-precision outer products in case of the half-precision variant, $SVL_S \div 2 \times SVL_S \div 2$ single-precision outer products in case of the single-precision variant, or $SVL_D \div 2 \times SVL_D \div 2$ double-precision outer products in case of the double-precision variant are destructively added to the destination ZA tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 12 classes: Half-precision, single and multiple vectors , Half-precision, single vectors , Half-precision, multiple and single vectors , Half-precision, multiple vectors , Single-precision, single and multiple vectors , Single-precision, single vectors , Single-precision, multiple and single vectors , Single-precision, multiple vectors , Double-precision, single and multiple vectors , Double-precision, single vectors , Double-precision, multiple and single vectors and Double-precision, multiple vectors

FMOP4A (widening, 2-way, FP16 to FP32)

Half-precision quarter-tile sum of outer products to single-precision, accumulating

This instruction generates four independent quarter-tile half-precision sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of half-precision values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of half-precision values held in the half-vectors of the second source vectors. Each 32-bit container of the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vectors holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix.

The instruction widens the sub-matrices of half-precision values held in the first source vectors to single-precision values and multiplies them by the corresponding widened sub-matrices of half-precision values in the second source vectors to single-precision values. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ single-precision sums of outer products are then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

FMOP4A (widening, 2-way, FP8 to FP16)

8-bit floating-point quarter-tile sum of outer products to half-precision, accumulating

This instruction generates four independent quarter-tile 8-bit floating-point sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 16-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_H \div 2 \times 2$ sub-matrix of 8-bit floating-point values held in the half-vectors of the first source vectors by the $2 \times SVL_H \div 2$ sub-matrix of 8-bit floating-point values held in the half-vectors of the second source vectors. Each 16-bit container of the first source vectors holds 2 elements of each row of a $SVL_H \div 2 \times 2$ sub-matrix. Similarly, each 16-bit container of the second source vectors holds 2 elements of each column of a $2 \times SVL_H \div 2$ sub-matrix.

This instruction widens the sub-matrices of 8-bit floating-point values held in the first source vectors to half-precision values and multiplies them by the corresponding widened sub-matrices of 8-bit floating-point values in the second source vectors to half-precision values. The resulting quarter-tile $SVL_H \div 2 \times SVL_H \div 2$ half-precision sums of outer products are scaled by $2^{-UInt(FPMR.LSCALE[3:0])}$, before being destructively added to the half-precision destination tile. This is equivalent to performing a downscaled 2-way dot product and accumulate to each of the destination tile elements.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

FMOP4A (widening, 4-way)

8-bit floating-point quarter-tile sum of outer products to single-precision, accumulating

This instruction generates four independent quarter-tile 8-bit floating-point sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit floating-point values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit floating-point values held in the half-vectors of the second source vectors. Each 32-bit container of the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the second source vectors holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.

This instruction widens the sub-matrices of 8-bit floating-point values held in the first source vectors to single-precision values and multiplies them by the corresponding widened sub-matrices of 8-bit floating-point values in the second source vectors to single-precision values. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ single-precision sums of outer products are scaled by $2^{-UInt(FPMR.LSCALE)}$, before being destructively added to the single-precision destination tile. This is equivalent to performing a downscaled 4-way dot product and accumulate to each of the destination tile elements.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

FMOP4S (non-widening)

Floating-point quarter-tile outer product, subtracting

This instruction generates four independent quarter-tile floating-point outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 16-bit, 32-bit, or 64-bit element ZA tile.

In case of the half-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_H \div 2 \times 1$ sub-matrix of half-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_H \div 2$ sub-matrix of half-precision values held in the half-vectors of the second source vectors. In case of the single-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_S \div 2 \times 1$ sub-matrix of single-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_S \div 2$ sub-matrix of single-precision values held in the half-vectors of the second source vectors. In case of the double-precision variant, each of the quarter-tile outer products is generated by multiplying the $SVL_D \div 2 \times 1$ sub-matrix of double-precision values held in the half-vectors of the first source vectors by the $1 \times SVL_D \div 2$ sub-matrix of double-precision values held in the half-vectors of the second source vectors.

The resulting quarter-tile $SVL_H \div 2 \times SVL_H \div 2$ half-precision outer products in case of the half-precision variant, $SVL_S \div 2 \times SVL_S \div 2$ single-precision outer products in case of the single-precision variant, or $SVL_D \div 2 \times SVL_D \div 2$ double-precision outer products in case of the double-precision variant are destructively subtracted from the destination ZA tile. This is equivalent to performing a single multiply-subtract from each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

FMOP4S (widening)

Half-precision quarter-tile sum of outer products to single-precision, subtracting

This instruction generates four independent quarter-tile half-precision sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of half-precision values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of half-precision values held in the half-vectors of the second source vectors. Each 32-bit container of the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vectors holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix.

The instruction widens the sub-matrices of half-precision values held in the first source vectors to single-precision values and multiplies them by the corresponding widened sub-matrices of half-precision values in the second source vectors to single-precision values. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ single-precision sums of outer products are then destructively subtracted from the single-precision destination tile. This is equivalent to performing a 2-way dot product and subtract from each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

FMOPA (non-widening)

Floating-point outer product, accumulating

The half-precision variant works with a 16-bit element ZA tile.
The single-precision variant works with a 32-bit element ZA tile.
The double-precision variant works with a 64-bit element ZA tile.
This instruction generates an outer product of the first source vector and the second source vector. In case of the half-precision variant, the first source is $SVL_H \times 1$ vector and the second source is $1 \times SVL_H$ vector. In case of the single-precision variant, the first source is $SVL_S \times 1$ vector and the second source is $1 \times SVL_S$ vector. In case of the double-precision variant, the first source is $SVL_D \times 1$ vector and the second source is $1 \times SVL_D$ vector.
Each source vector is independently predicated by a corresponding governing predicate. When either source vector element is Inactive the corresponding destination tile element remains unmodified.
The resulting outer product, $SVL_H \times SVL_H$ in case of half-precision variant, $SVL_S \times SVL_S$ in case of single-precision variant or $SVL_D \times SVL_D$ in case of double-precision variant, is then destructively added to the destination tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.
This instruction follows SME ZA-targeting floating-point behaviors.
ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented, and ID_AA64SMFR0_EL1.F16F16 indicates whether the half-precision variant is implemented.
It has encodings from 3 classes: Half-precision , Single-precision and Double-precision

FMOPA (widening, 2-way, FP16 to FP32)

Half-precision sum of outer products to single-precision, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction widens the $SVL_S \times 2$ sub-matrix of half-precision values held in the first source vector to single-precision values and multiplies it by the widened $2 \times SVL_S$ sub-matrix of half-precision values in the second source vector to single-precision values.

Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is Inactive it is treated as having the value +0.0, but if both pairs of source vector elements that correspond to a 32-bit destination element contain Inactive elements, then the destination element remains unmodified.
The resulting $SVL_S \times SVL_S$ single-precision sum of outer products is then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

This instruction follows SME ZA-targeting floating-point behaviors.

FMOPA (widening, 2-way, FP8 to FP16)

8-bit floating-point sum of outer products to half-precision, accumulating

This instruction works with a 16-bit element ZA tile.
This instruction widens the $SVL_H \times 2$ sub-matrix of 8-bit floating-point values held in the first source vector to half-precision values and multiplies it by the widened $2 \times SVL_H$ sub-matrix of 8-bit floating-point values in the second source vector to half-precision values.

Each source vector is independently predicated by a corresponding governing predicate. When a 8-bit source element is Inactive it is treated as having the value +0.0, but if both groups of source vector elements that correspond to a 16-bit destination element contain Inactive elements, then the destination element remains unmodified.

The resulting $SVL_H \times SVL_H$ half-precision sum of outer products are scaled by $2^{-UInt(FPMR.LSCALE[3:0])}$, before being destructively added to the half-precision destination tile. This is equivalent to performing a downscaled 2-way dot product and accumulate to each of the destination tile elements.

Each 16-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_H \times 2$ sub-matrix. Similarly, each 16-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_H$ sub-matrix.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

FMOPA (widening, 4-way)

8-bit floating-point sum of outer products to single-precision, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction widens the $SVL_S \times 4$ sub-matrix of 8-bit floating-point values held in the first source vector to single-precision values and multiplies it by the widened $4 \times SVL_S$ sub-matrix of 8-bit floating-point values in the second source vector to single-precision values.

Each source vector is independently predicated by a corresponding governing predicate. When a 8-bit source element is Inactive it is treated as having the value +0.0, but if both groups of source vector elements that correspond to a 32-bit destination element contain Inactive elements, then the destination element remains unmodified.

The resulting $SVL_S \times SVL_S$ single-precision sum of outer products are scaled by $2^{-UInt(FPMR.LSCALE)}$, before being destructively added to the single-precision destination tile. This is equivalent to performing a downscaled 4-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix. Similarly, each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

FMOPS (non-widening)

Floating-point outer product, subtracting

The half-precision variant works with a 16-bit element ZA tile.
The single-precision variant works with a 32-bit element ZA tile.
The double-precision variant works with a 64-bit element ZA tile.
This instruction generates an outer product of the first source vector and the second source vector. In case of the half-precision variant, the first source is $SVL_H \times 1$ vector and the second source is $1 \times SVL_H$ vector. In case of the single-precision variant, the first source is $SVL_S \times 1$ vector and the second source is $1 \times SVL_S$ vector. In case of the double-precision variant, the first source is $SVL_D \times 1$ vector and the second source is $1 \times SVL_D$ vector.
Each source vector is independently predicated by a corresponding governing predicate. When either source vector element is Inactive the corresponding destination tile element remains unmodified.
The resulting outer product, $SVL_H \times SVL_H$ in case of half-precision variant, $SVL_S \times SVL_S$ in case of single-precision variant or $SVL_D \times SVL_D$ in case of double-precision variant, is then destructively subtracted from the destination tile. This is equivalent to performing a single multiply-subtract from each of the destination tile elements.
This instruction follows SME ZA-targeting floating-point behaviors.
ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented, and ID_AA64SMFR0_EL1.F16F16 indicates whether the half-precision variant is implemented.
It has encodings from 3 classes: Half-precision , Single-precision and Double-precision

FMUL (multiple and single vector)

Multi-vector floating-point multiply by vector

This instruction multiplies all the floating-point elements of the two or four first source vectors by the corresponding floating-point elements of the second source vector, and places the results in the corresponding elements of the two or four destination vectors.

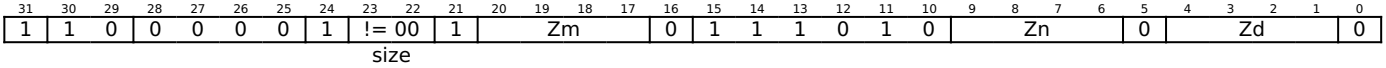
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2p2)



Encoding

```
FMUL { <Zd1>.<T>-<Zd2>.<T> }, { <Zn1>.<T>-<Zn2>.<T> }, <Zm>.<T>
```

FMUL (multiple vectors)

Multi-vector floating-point multiply

This instruction multiplies all the floating-point elements of the two or four first source vectors by the corresponding floating-point elements of the two or four second source vectors, and places the results in the corresponding elements of the two or four destination vectors.

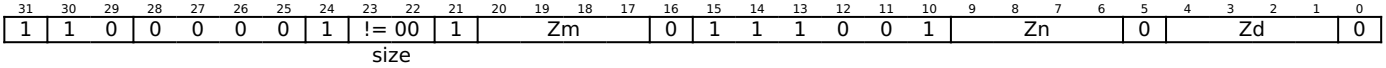
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2p2)



Encoding

```
FMUL { <Zd1>.<T>-<Zd2>.<T> }, { <Zn1>.<T>-<Zn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Zd::'0');
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let nreg : integer{} = 2;
```

For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : integer = SInt(operand2[e*:esize]);
        results[[r]][e*:esize] = FPScale{esize}(element1, element2, FPCR());
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(dn+r) = results[[r]];
end;
```

FSUB

Multi-vector floating-point subtract from ZA array vectors

This instruction destructively subtracts all elements of the two or four source vectors from the corresponding elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented, and ID_AA64SMFR0_EL1.F16F16 indicates whether the half-precision variant is implemented.

It has encodings from 4 classes: Two ZA single-vectors , Two ZA single-vectors of half-precision elements , Four ZA single-vectors and Four ZA single-vectors of half-precision elements

FTMOPA (non-widening)

Floating-point sparse outer product, accumulating

This instruction generates floating-point outer product by multiplying the 1-in-2 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the destination ZA tile elements.

In case of the half-precision variant, the outer product is generated by multiplying the selected 1-in-2 half-precision value from each overlapping 16-bit containers of the two $SVL_H \times 1$ sub-matrices in the first source vectors by the half-precision value from the corresponding 16-bit container of the compressed $1 \times SVL_H$ sub-matrix in the second source vector. In case of the single-precision variant, the outer product is generated by multiplying the selected 1-in-2 single-precision value from each overlapping 32-bit containers of the two $SVL_S \times 1$ sub-matrices in the first source vectors by the single-precision value from the corresponding 32-bit container of the compressed $1 \times SVL_S$ sub-matrix in the second source vector.

The 1-in-2 floating-point value in the first source vectors is selected by 2-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the result. If both bits of the 2-bit control corresponding to the elements of the first source vectors are 1, only the element corresponding to the least significant bit is selected.

The instruction multiplies the selected elements of sub-matrices of floating-point values held in the first source vectors by the corresponding elements of sub-matrix of floating-point values in the second source vector. The resulting outer product, $SVL_H \times SVL_H$ in case of the half-precision variant or $SVL_S \times SVL_S$ in case of the single-precision variant, is then destructively added to the destination tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

It has encodings from 2 classes: Half-precision and Single-precision

Half-precision

(FEAT_SME_TMOP && FEAT_SME_F16F16)

FTMOPA (widening, 2-way, FP16 to FP32)

Half-precision sparse sum of outer products to single-precision, accumulating

This instruction generates half-precision sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected 2-in-4 half-precision values from each overlapping 32-bit containers of the two $SVL_S \times 2$ sub-matrices in the first source vectors by the two half-precision values from the corresponding 32-bit container of the $2 \times SVL_S$ sub-matrix in the second source vector. The two selected elements from each overlapping 32-bit containers of the first source vectors correspond to 2-in-4 elements of rows of two $SVL_S \times 2$ sub-matrices. Each 32-bit container of the second source vector holds 2 elements of columns of a compressed $2 \times SVL_S$ sub-matrix.

The 2-in-4 half-precision values from overlapping 32-bit containers of the first source vectors are selected by 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to 32-bit containers of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The instruction widens the selected elements of sub-matrices of half-precision values held in the first source vectors to single-precision values and multiplies them by the corresponding widened elements of sub-matrix of half-precision values in the second source vector to single-precision values. The resulting $SVL_S \times SVL_S$ single-precision sum of outer products is then destructively added to the single-precision destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

FTMOPA (widening, 2-way, FP8 to FP16)

8-bit floating-point sparse sum of outer products to half-precision, accumulating

This instruction generates 8-bit floating-point sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 16-bit element ZA tile.

The sum of outer products is generated by multiplying the selected 2-in-4 8-bit floating-point values from each overlapping 16-bit containers of the two $SVL_H \times 2$ sub-matrices in the first source vectors by the two 8-bit floating point values from the corresponding 16-bit container of the $2 \times SVL_H$ sub-matrix in the second source vector. The two selected elements from each overlapping 16-bit containers of the first source vectors correspond to 2-in-4 elements of rows of two $SVL_H \times 2$ sub-matrices. Each 16-bit container of the second source vector holds 2 elements of columns of a compressed $2 \times SVL_H$ sub-matrix.

The 2-in-4 8-bit floating values from overlapping 16-bit containers of the first source vectors are selected by 4-bit control in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to 16-bit containers of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The instruction widens the selected elements of sub-matrices of 8-bit floating-point values held in the first source vectors to half-precision values and multiplies them by the corresponding widened elements of sub-matrix of 8-bit floating-point values in the second source vector to half-precision values. The resulting $SVL_H \times SVL_H$ half-precision sum of outer products is scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$, before being destructively added to the half-precision destination tile. This is equivalent to performing a downscaled 2-way dot product and accumulate to each of the destination tile elements.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

FTMOPA (widening, 4-way)

8-bit floating-point sparse sum of outer products to single-precision, accumulating

This instruction generates 8-bit floating-point sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected two sets of 2-in-4 8-bit floating-point values from each overlapping 32-bit containers of the two $SVL_S \times 4$ sub-matrices in the first source vectors by the four 8-bit floating-point values from the corresponding 32-bit container of the $4 \times SVL_S$ sub-matrix in the second source vector. The four selected elements from the overlapping 32-bit containers of the first source vectors correspond to two sets of 2-in-4 elements of rows of two $SVL_S \times 4$ sub-matrices. Each 32-bit container of the second source vector holds 4 elements of columns of a compressed $4 \times SVL_S$ sub-matrix.

The two sets of 2-in-4 8-bit floating values from overlapping 32-bit containers of the first source vectors are selected by pairs of 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to each 32-bit container of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The instruction widens the selected elements of sub-matrices of 8-bit floating-point values held in the first source vectors to single-precision values and multiplies them by the corresponding widened elements of sub-matrix of 8-bit floating-point values in the second source vector to single-precision values. The resulting $SVL_S \times SVL_S$ single-precision sum of outer products is scaled by $2^{-UInt(FPMR.LSCALE)}$, before being destructively added to the single-precision destination tile. This is equivalent to performing a downscaled 4-way dot product and accumulate to each of the destination tile elements.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

FVDOT (FP16 to FP32)

Multi-vector half-precision vertical dot product by indexed element to single-precision

This instruction calculates the fused sum-of-products of each vertical pair of half-precision values in the corresponding elements of the two first source vectors with the pair of half-precision values in the indexed 32-bit group of the corresponding 128-bit segment of the second source vector, without intermediate rounding. The single-precision sum-of-products are destructively added to the corresponding single-precision elements of the two ZA single-vector groups.

The half-precision pairs within the second source vector are specified using an immediate index that selects the same pair position within each 128-bit vector segment. The element index range is from 0 to 3.

The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

The vector group symbol VGx2 indicates that the ZA operand consists of two ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction follows SME ZA-targeting floating-point behaviors.

This instruction is unpredicated.

LD1B (scalar plus immediate, strided registers)

Contiguous load of bytes to multiple strided vectors (immediate index)

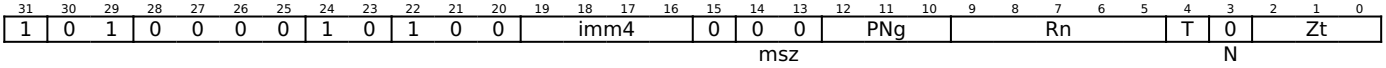
This instruction performs a contiguous load of unsigned bytes to elements of two or four strided vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

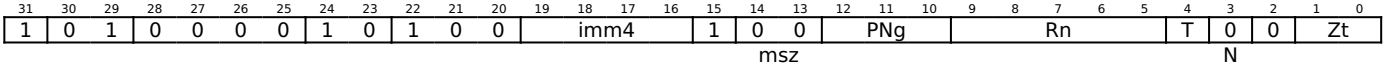
```
LD1B { <Zt1>.B, <Zt2>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```
LD1B { <Zt1>.B, <Zt2>.B, <Zt3>.B, <Zt4>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt".
	For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".
<Zt2>	For the "Two registers" variant: is the name of the second scalable vector register Z8-Z15 or Z24-Z31 to be transferred, encoded as "T:'1':Zt".
	For the "Four registers" variant: is the name of the second scalable vector register Z4-Z7 or Z20-Z23 to be transferred, encoded as "T:'01':Zt".
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2.
	For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt3>	Is the name of the third scalable vector register Z8-Z11 or Z24-Z27 to be transferred, encoded as "T:'10':Zt".
<Zt4>	Is the name of the fourth scalable vector register Z12-Z15 or Z28-Z31 to be transferred, encoded as "T:'11':Zt".

LD1B (scalar plus scalar, strided registers)

Contiguous load of bytes to multiple strided vectors (scalar index)

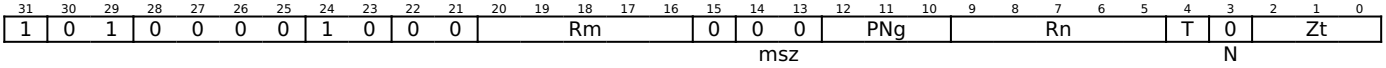
This instruction performs a contiguous load of unsigned bytes to elements of two or four strided vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

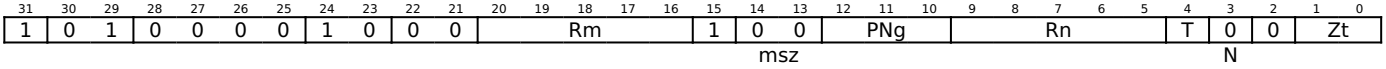
```
LD1B { <Zt1>.B, <Zt2>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 8;
```

Four registers

(FEAT_SME2)



Encoding

```
LD1B { <Zt1>.B, <Zt2>.B, <Zt3>.B, <Zt4>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 8;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".

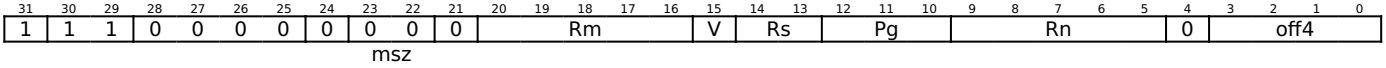
LD1B (scalar plus scalar, tile slice)

Contiguous load of bytes to 8-bit element ZA tile slice

This instruction performs a contiguous load of bytes to an 8-bit element ZA tile slice. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of 8-bit elements in a vector. The immediate offset is in the range 0 to 15. The memory address is generated by a 64-bit scalar base and an optional 64-bit scalar offset that is added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

SME

(FEAT_SME)



Encoding

```
LD1B { ZA0<HV>.B[<Ws>, <offs>] }, <Pg>/Z, [<Xn|SP>{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('0'::Pg);
let s : integer = UInt('011'::Rs);
let t : integer = 0;
let offset : integer = UInt(off4);
let esize : integer{} = 8;
let vertical : boolean = V == '1';
```

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> Is the slice index offset, in the range 0 to 15, encoded in the "off4" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

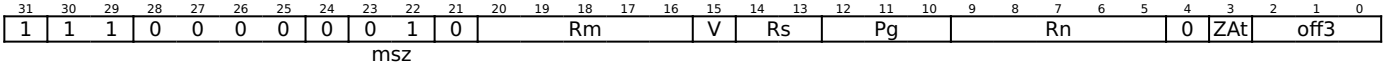
LD1H (scalar plus scalar, tile slice)

Contiguous load of halfwords to 16-bit element ZA tile slice

This instruction performs a contiguous load of halfwords to a 16-bit element ZA tile slice. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of 16-bit elements in a vector. The immediate offset is in the range 0 to 7. The memory address is generated by a 64-bit scalar base and an optional 64-bit scalar offset that is multiplied by 2 and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

SME

(FEAT_SME)



Encoding

```
LD1H { <ZAt><HV>.H[<Ws>, <offs>] }, <Pg>/Z, [<Xn|SP>{, <Xm>, LSL #1}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);

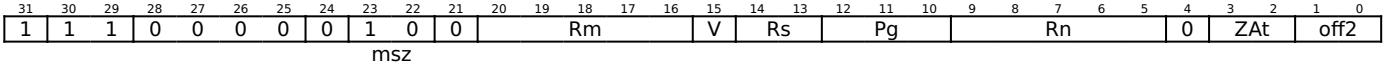
LD1W (scalar plus scalar, tile slice)

Contiguous load of words to 32-bit element ZA tile slice

This instruction performs a contiguous load of words to a 32-bit element ZA tile slice. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of 32-bit elements in a vector. The immediate offset is in the range 0 to 3. The memory address is generated by a 64-bit scalar base and an optional 64-bit scalar offset that is multiplied by 4 and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

SME

(FEAT_SME)



Encoding

```
LD1W { <ZAt><HV>.S[<Ws>, <offs>] }, <Pg>/Z, [<Xn|SP>{, <Xm>, LSL #2}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('0'::Pg);
let s : integer = UInt('011'::Rs);
let t : integer = UInt(ZAt);
let offset : integer = UInt(off2);
let esize : integer{} = 32;
let vertical : boolean = V == '1';
```

Assembler Symbols

<ZAt> Is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAt" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> Is the slice index offset, in the range 0 to 3, encoded in the "off2" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer = VL DIV esize;
var base : bits(64);
var addr : bits(64);
let mask : bits(PL) = P{}(g);
var moffs : bits(64) = X{}(m);
let index : bits(32) = X{}(s);
let slice : integer = (UInt(index) + offset) MOD dim;
var result : bits(VL);
let mbytes : integer{} = esize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSME(MemOp_LOAD, nontemporal, contiguous,
                                                  tagchecked);

if n == 31 then
    if (AnyActiveElement{PL}(mask, esize) ||

LDNT1B (scalar plus immediate, strided registers)

Contiguous load non-temporal of bytes to multiple strided vectors (immediate index)

This instruction performs a contiguous non-temporal load of bytes to elements of two or four strided vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

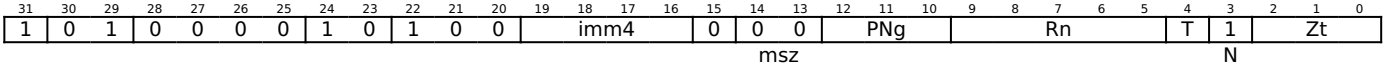
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

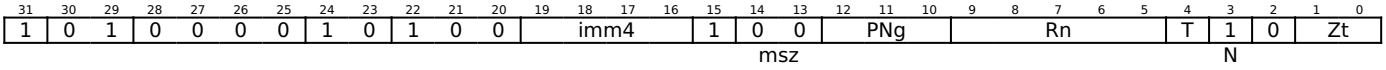
```
LDNT1B { <Zt1>.B, <Zt2>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```
LDNT1B { <Zt1>.B, <Zt2>.B, <Zt3>.B, <Zt4>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".

LDNT1H (scalar plus immediate, strided registers)

Contiguous load non-temporal of halfwords to multiple strided vectors (immediate index)

This instruction performs a contiguous non-temporal load of halfwords to elements of two or four strided vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

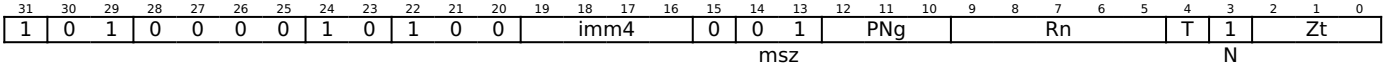
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

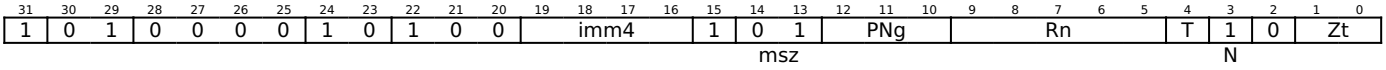
```
LDNT1H { <Zt1>.H, <Zt2>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```
LDNT1H { <Zt1>.H, <Zt2>.H, <Zt3>.H, <Zt4>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Assembler Symbols

LDR (array vector)

Load ZA array vector

This instruction performs a contiguous load of bytes to a ZA array vector from the memory address generated by a 64-bit scalar base plus an optional immediate offset multiplied by the current vector length in bytes. The ZA array vector is selected by the sum of the vector select register and the same immediate offset, modulo the number of bytes in a Streaming SVE vector.

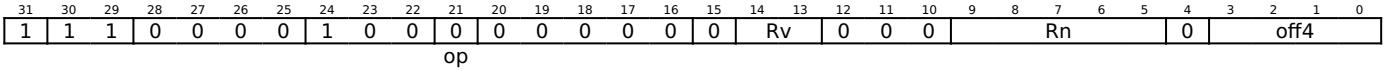
This instruction is unpredicated.

The load is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME

(FEAT_SME)



Encoding

```
LDR ZA[<Wv>, <offs>], [<Xn|SP>{, #<offs>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let v : integer = UInt('011'::Rv);
let offset : integer = UInt(off4);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W12-W15, encoded as "Rv" plus 12.
<offs>	Is the vector select offset and optional memory offset, in the range 0 to 15, defaulting to 0, encoded in the "off4" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEAndZAEnabled();
let SVL : integer{} = CurrentSVL();
let dim : integer{} = SVL DIV 8;
var base : bits(64);
let moffs : integer = offset * dim;
var result : bits(SVL);
let vbase : bits(32) = X{32}(v);
let vec : integer = (UInt(vbase) + offset) MOD dim;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSME(MemOp_LOAD, nontemporal, contiguous,
                                                  tagchecked);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;
var addr : bits(64) = AddressAdd(base, moffs, accdesc);
let aligned : boolean = IsAlignedSize(base, 16);
if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;
for e = 0 to dim-1 do
    result[e*:8] = AArch64_MemSingle{8}(addr, accdesc, aligned);
    addr = AddressIncrement(addr, 1, accdesc);
end;

ZAvector{SVL}(vec) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LDR (table)

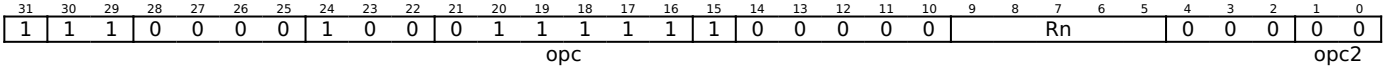
Load ZT0 register

This instruction loads the 64-byte ZT0 register from the memory address provided in the 64-bit scalar base register. This instruction is unpredicated. The load is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME2

(FEAT_SME2)



Encoding

```
LDR ZT0, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let esize : integer{} = 8;
```

Assembler Symbols

<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();
let tablesize : integer{} = 512;
let elements : integer = tablesize DIV esize;
var addr : bits(64);
var result : bits(tablesize);
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSME(MemOp_LOAD, nontemporal, contiguous,
                                                  tagchecked);

if n == 31 then
    CheckSPAlignment();
    addr = SP{64}();
else
    addr = X{64}(n);
end;
let aligned : boolean = IsAlignedSize(addr, 16);
if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;
for e = 0 to elements-1 do
    result[e*:esize] = AArch64_MemSingle{esize}(addr, accdesc, aligned);
    addr = AddressIncrement(addr, esize DIV 8, accdesc);
end;

ZT0{tablesize}() = result;
```

LUTI2 (four registers)

Lookup table read with 2-bit indexes (four registers)

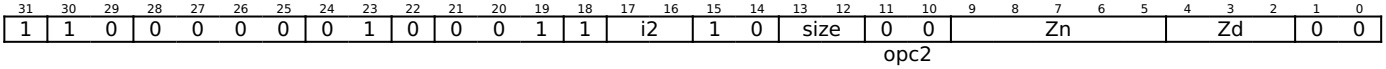
This instruction copies 8-bit, 16-bit or 32-bit elements from ZT0 to four destination vectors using packed 2-bit indices from a segment of the source vector register. A segment corresponds to a portion of the source vector that is consumed in order to fill the destination vector. The segment is selected by the vector segment index modulo the total number of segments.

This instruction is unpredicated.

It has encodings from 2 classes: Consecutive and Strided

Consecutive

(FEAT_SME2)



Encoding

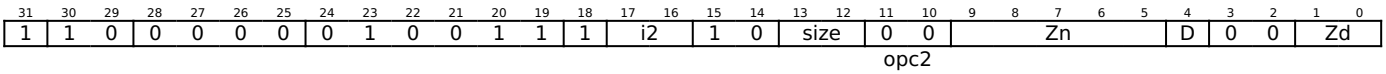
```
LUTI2 { <Zd1>.<T>-<Zd4>.<T> }, ZT0, <Zn>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let isize : integer{} = 2;
let n : integer = UInt(Zn);
let dstride : integer = 1;
let d : integer = UInt(Zd::'00');
let imm : integer = UInt(i2);
let nreg : integer{} = 4;
```

Strided

(FEAT_SME2p1)



Encoding

```
LUTI2 { <Zd1>.<T>, <Zd2>.<T>, <Zd3>.<T>, <Zd4>.<T> }, ZT0, <Zn>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
if size == '10' || size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let isize : integer{} = 2;
let n : integer = UInt(Zn);
let dstride : integer = 4;
let d : integer = UInt(D::'00'::Zd);
let imm : integer = UInt(i2);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1> For the "Consecutive" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

For the "Strided" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 of the destination multi-vector group, encoded as "D:'00':Zd".

<T> For the "Consecutive" variant: is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	RESERVED

For the "Strided" variant: is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	B
1	H

<Zd4>	For the "Consecutive" variant: is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3. For the "Strided" variant: is the name of the fourth scalable vector register Z12-Z15 or Z28-Z31 of the destination multi-vector group, encoded as "D:'11':Zd".
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.
<index>	Is the vector segment index, in the range 0 to 3, encoded in the "i2" field.
<Zd2>	Is the name of the second scalable vector register Z4-Z7 or Z20-Z23 of the destination multi-vector group, encoded as "D:'01':Zd".
<Zd3>	Is the name of the third scalable vector register Z8-Z11 or Z24-Z27 of the destination multi-vector group, encoded as "D:'10':Zd".

Operation

```
CheckStreamingSVEEnabled();
CheckSMEZT0Enabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let segments : integer = (esize DIV (isize * nreg)) as integer{1, 2, 4, 8, 16};
let segment : integer = imm MOD segments;
let indexes : bits(VL) = Z{VL}(n);
var dst : integer = d;
let table : bits(512) = ZT0{}();

for r = 0 to nreg-1 do
    let base : integer = (segment * nreg + r) * elements;
    var result : bits(VL);
    for e = 0 to elements-1 do
        let index : integer = UInt(indexes[(base+e)*:isize]);
        result[e*:esize] = table[index*:32][esize-1:0];
    end;
    Z{VL}(dst) = result;
    dst = dst + dstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LUTI4 (two registers)

Lookup table read with 4-bit indexes (two registers)

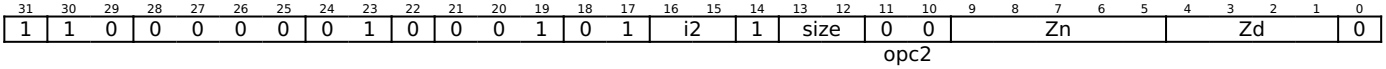
This instruction copies 8-bit, 16-bit or 32-bit elements from ZT0 to two destination vectors using packed 4-bit indices from a segment of the source vector register. A segment corresponds to a portion of the source vector that is consumed in order to fill the destination vector. The segment is selected by the vector segment index modulo the total number of segments.

This instruction is unpredicated.

It has encodings from 2 classes: Consecutive and Strided

Consecutive

(FEAT_SME2)



Encoding

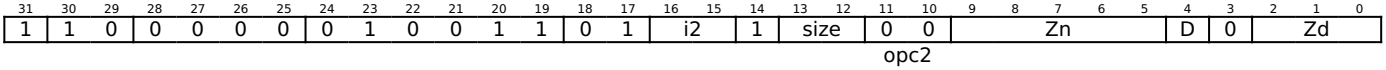
```
LUTI4 { <Zd1>.<T>-<Zd2>.<T> }, ZT0, <Zn>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let isize : integer{} = 4;
let n : integer = UInt(Zn);
let dstride : integer = 1;
let d : integer = UInt(Zd::'0');
let imm : integer = UInt(i2);
let nreg : integer{} = 2;
```

Strided

(FEAT_SME2p1)



Encoding

```
LUTI4 { <Zd1>.<T>, <Zd2>.<T> }, ZT0, <Zn>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
if size == '10' || size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let isize : integer{} = 4;
let n : integer = UInt(Zn);
let dstride : integer = 8;
let d : integer = UInt(D::'0'::Zd);
let imm : integer = UInt(i2);
let nreg : integer{} = 2;
```

Assembler Symbols

<Zd1> For the "Consecutive" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Strided" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 of the destination multi-vector group, encoded as "D:'0':Zd".

<T> For the "Consecutive" variant: is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	RESERVED

For the "Strided" variant: is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	B
1	H

<Zd2>	For the "Consecutive" variant: is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1. For the "Strided" variant: is the name of the second scalable vector register Z8-Z15 or Z24-Z31 of the destination multi-vector group, encoded as "D:'1':Zd".
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.
<index>	Is the vector segment index, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEEnabled();
CheckSMEZT0Enabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let segments : integer = (esize DIV (isize * nreg)) as integer{1, 2, 4, 8, 16};
let segment : integer = imm MOD segments;
let indexes : bits(VL) = Z{VL}(n);
var dst : integer = d;
let table : bits(512) = ZT0{}();

for r = 0 to nreg-1 do
    let base : integer = (segment * nreg + r) * elements;
    var result : bits(VL);
    for e = 0 to elements-1 do
        let index : integer = UInt(indexes[(base+e)*:isize]);
        result[e*:esize] = table[index*:32][esize-1:0];
    end;
    Z{VL}(dst) = result;
    dst = dst + dstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LUTI6 (table, four registers, 8-bit)

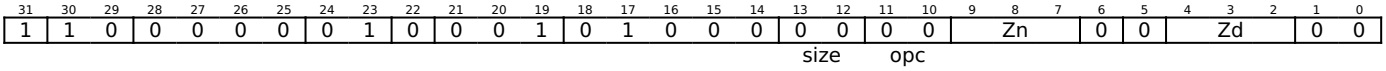
Lookup table read with 6-bit indices (8-bit)

This instruction copies indexed 8-bit elements from ZT0 to four destination vectors using packed 6-bit indices in the three source vectors. This instruction is unpredicated.

It has encodings from 2 classes: Consecutive and Strided

Consecutive

(FEAT_SME2p3)



Encoding

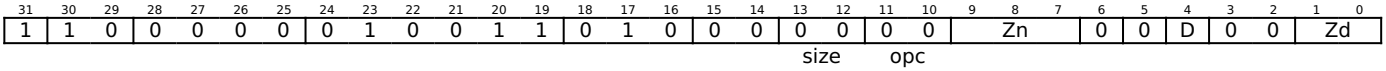
```
LUTI6 { <Zd1>.B-<Zd4>.B }, ZT0, { <Zn1>-<Zn3> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p3) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8;
let isize : integer{} = 6;
let n : integer = UInt('00'::Zn);
let dstride : integer = 1;
let d : integer = UInt(Zd::'00');
```

Strided

(FEAT_SME2p3)



Encoding

```
LUTI6 { <Zd1>.B, <Zd2>.B, <Zd3>.B, <Zd4>.B }, ZT0, { <Zn1>-<Zn3> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p3) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8;
let isize : integer{} = 6;
let n : integer = UInt('00'::Zn);
let dstride : integer = 4;
let d : integer = UInt(D::'00'::Zd);
```

Assembler Symbols

<Zd1>	For the "Consecutive" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4. For the "Strided" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 of the destination multi-vector group, encoded as "D:'00':Zd".
<Zd4>	For the "Consecutive" variant: is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3. For the "Strided" variant: is the name of the fourth scalable vector register Z12-Z15 or Z28-Z31 of the destination multi-vector group, encoded as "D:'11':Zd".
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group Z0-Z7, encoded in the "Zn" field.
<Zn3>	Is the name of the third scalable vector register of the source multi-vector group Z2-Z9, encoded as "Zn" plus 2.
<Zd2>	Is the name of the second scalable vector register Z4-Z7 or Z20-Z23 of the destination multi-vector group, encoded as "D:'01':Zd".
<Zd3>	Is the name of the third scalable vector register Z8-Z11 or Z24-Z27 of the destination multi-vector group, encoded as "D:'10':Zd".

Operation

```
CheckStreamingSVEEnabled();
CheckSMEZT0Enabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let indexes : bits(3 * VL) = Z{VL}(n+2) :: Z{VL}(n+1) :: Z{VL}(n);
var dst : integer = d;
let table : bits(512) = ZT0{}();
for r = 0 to 3 do
    let base : integer = r * elements;
    var result : bits(VL);
    for e = 0 to elements-1 do
        let index : integer = UInt(indexes[(base+e)*:isize]);
        result[e*:esize] = table[index*:esize];
    end;
    Z{VL}(dst) = result;
    dst = dst + dstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

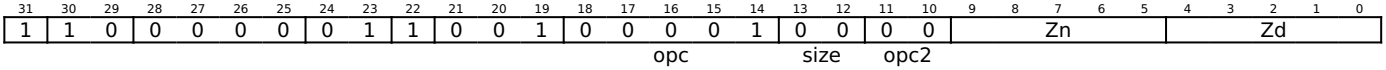
LUTI6 (table, single, 8-bit)

Lookup table read with 6-bit indices (single)

This instruction copies indexed 8-bit elements from ZT0 to the destination vector using packed 6-bit indices from the bottom three quarters of the source vector. This instruction is unpredicated.

SME2

(FEAT_SME2p3)



Encoding

```
LUTI6 <Zd>.B, ZT0, <Zn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p3) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8;
let isize : integer{} = 6;
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckStreamingSVEEnabled();
CheckSMEZT0Enabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let indexes : bits(VL) = Z{VL}(n); // Only 3/4 used
let table : bits(512) = ZT0{}();
var result : bits(VL);
for e = 0 to elements-1 do
    let index : integer = UInt(indexes[e*:isize]);
    result[e*:esize] = table[index*:esize];
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LUTI6 (vector, 16-bit)

Lookup table read with 6-bit indices (16-bit)

This instruction copies indexed 16-bit elements from the low 512 bits of the two table vectors to four destination vectors using packed 6-bit indices in the low or high one and a half vector segment of the two source vectors. The source vectors segment consumed in order to fill the destination vectors is selected by the source vector segment index. This instruction is unpredicated. This instruction requires that the Effective SVE vector length is at least 512 bits.

It has encodings from 2 classes: Consecutive and Strided

Consecutive

(FEAT_SME2p3)

Encoding

```
LUTI6 { <Zd1>.H-<Zd4>.H }, { <Zn1>.H, <Zn2>.H }, { <Zm1>-<Zm2> }[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p3) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 16;
let isize : integer{} = 6;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let dstride : integer = 1;
let d : integer = UInt(Zd::'00');
let select : integer = UInt(i1);
```

Strided

(FEAT_SME2p3)

Encoding

```
LUTI6 { <Zd1>.H, <Zd2>.H, <Zd3>.H, <Zd4>.H }, { <Zn1>.H, <Zn2>.H }, { <Zm1>-<Zm2> }[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p3) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 16;
let isize : integer{} = 6;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let dstride : integer = 4;
let d : integer = UInt(D::'00'::Zd);
let select : integer = UInt(i1);
```

Assembler Symbols

<Zd1>	For the "Consecutive" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4. MOV (array to vector, four registers)

Move four ZA single-vector groups to Z four-vector operand

This instruction operates on four ZA single-vector groups.
The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.
The vector group symbol VGx4 indicates that the instruction operates on four ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.

This is an alias of MOVA (array to vector, four registers). This means:

- The encodings in this description are named to match the encodings of MOVA (array to vector, four registers).
- The description of MOVA (array to vector, four registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SME2

(FEAT_SME2)

MOV (array to vector, two registers)

Move two ZA single-vector groups to Z two-vector operand

This instruction operates on two ZA single-vector groups.
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.
The vector group symbol VGx2 indicates that the instruction operates on two ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.

This is an alias of MOVA (array to vector, two registers). This means:

- The encodings in this description are named to match the encodings of MOVA (array to vector, two registers).
- The description of MOVA (array to vector, two registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SME2

(FEAT_SME2)

Encoding

```
MOV { <Zd1>.D-<Zd2>.D }, ZA.D[<Wv>, <offs>{, VGx2}]
```

is equivalent to

```
MOVA { <Zd1>.D-<Zd2>.D }, ZA.D[<Wv>, <offs>{, VGx2}]
```

and is always the preferred disassembly.

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

The description of MOVA (array to vector, two registers) gives the operational pseudocode for this instruction.

Operational Information

MOV (tile to vector, four registers)

Move ZA four-slice operand to Z four-vector operand

This instruction operates on a horizontal or vertical ZA four-slice operand within a ZA tile of the specified element size.
The first slice of the four-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 4, modulo the number of slices in the tile.
The immediate offset is a multiple of 4 in the range 0 to the number of elements in a 128-bit vector segment minus 4.
This instruction is unpredicated.

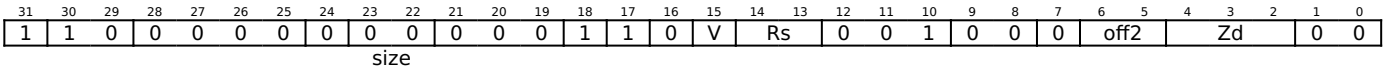
This is an alias of MOVA (tile to vector, four registers). This means:

- The encodings in this description are named to match the encodings of MOVA (tile to vector, four registers).
- The description of MOVA (tile to vector, four registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.B-<Zd4>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs4>]
```

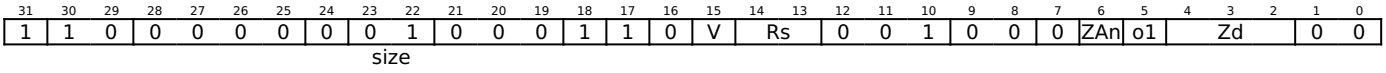
is equivalent to

```
MOVA { <Zd1>.B-<Zd4>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs4>]
```

and is always the preferred disassembly.

16-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.H-<Zd4>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs4>]
```

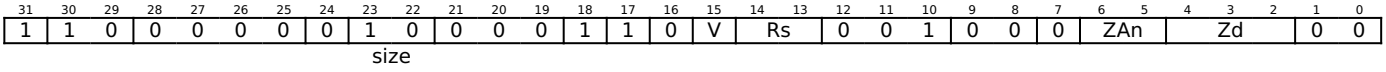
is equivalent to

```
MOVA { <Zd1>.H-<Zd4>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs4>]
```

and is always the preferred disassembly.

32-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.S-<Zd4>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs4>]
```

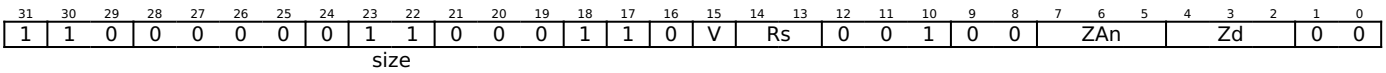
is equivalent to

```
MOVA { <Zd1>.S-<Zd4>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs4>]
```

and is always the preferred disassembly.

64-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.D-<Zd4>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs4>]
```

is equivalent to

```
MOVA { <Zd1>.D-<Zd4>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs4>]
```

and is always the preferred disassembly.

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off2" field times 4.
For the "16-bit" variant: is the first slice index offset, encoded as "o1" field times 4.
For the "32-bit" and "64-bit" variants: is the first slice index offset, with implicit value 0.

<offs4> For the "8-bit" variant: is the fourth slice index offset, encoded as "off2" field times 4 plus 3.
For the "16-bit" variant: is the fourth slice index offset, encoded as "o1" field times 4 plus 3.
For the "32-bit" and "64-bit" variants: is the fourth slice index offset, with implicit value 3.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

The description of MOVA (tile to vector, four registers) gives the operational pseudocode for this instruction.

Operational Information

The description of MOVA (tile to vector, four registers) gives the operational information for this instruction.

MOV (tile to vector, single)

Move ZA tile slice to Z vector

This instruction operates on individual horizontal or vertical slices within a named ZA tile of the specified element size. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of such elements in a vector. The immediate offset is in the range 0 to the number of elements in a 128-bit vector segment minus 1. Inactive elements in the destination vector remain unmodified.

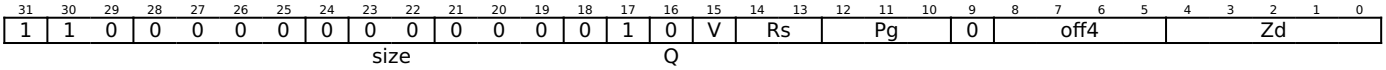
This is an alias of MOVA (tile to vector, single). This means:

- The encodings in this description are named to match the encodings of MOVA (tile to vector, single).
- The description of MOVA (tile to vector, single) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 5 classes: 8-bit , 16-bit , 32-bit , 64-bit and 128-bit

8-bit

(FEAT_SME)



Encoding

```
MOV <Zd>.B, <Pg>/M, ZA0<HV>.B[<Ws>, <offs>]
```

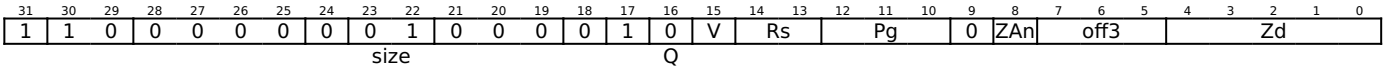
is equivalent to

```
MOVA <Zd>.B, <Pg>/M, ZA0<HV>.B[<Ws>, <offs>]
```

and is always the preferred disassembly.

16-bit

(FEAT_SME)



Encoding

```
MOV <Zd>.H, <Pg>/M, <ZAn><HV>.H[<Ws>, <offs>]
```

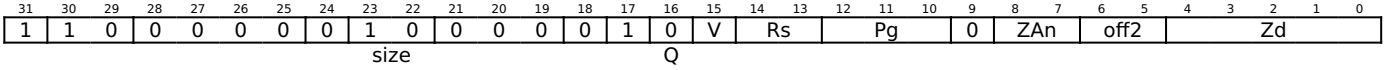
is equivalent to

```
MOVA <Zd>.H, <Pg>/M, <ZAn><HV>.H[<Ws>, <offs>]
```

and is always the preferred disassembly.

32-bit

(FEAT_SME)



Encoding

```
MOV <Zd>.S, <Pg>/M, <ZAn><HV>.S[<Ws>, <offs>]
```

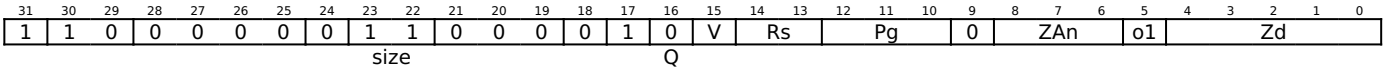
is equivalent to

```
MOVA <Zd>.S, <Pg>/M, <ZAn><HV>.S[<Ws>, <offs>]
```

and is always the preferred disassembly.

64-bit

(FEAT_SME)



Encoding

```
MOV <Zd>.D, <Pg>/M, <ZAn><HV>.D[<Ws>, <offs>]
```

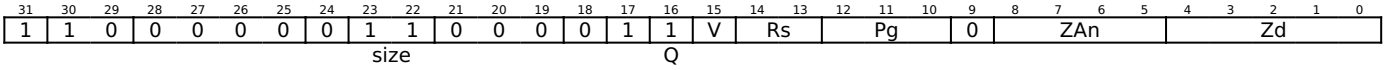
is equivalent to

```
MOVA <Zd>.D, <Pg>/M, <ZAn><HV>.D[<Ws>, <offs>]
```

and is always the preferred disassembly.

128-bit

(FEAT_SME)



Encoding

```
MOV <Zd>.Q, <Pg>/M, <ZAn><HV>.Q[<Ws>, <offs>]
```

is equivalent to

```
MOVA <Zd>.Q, <Pg>/M, <ZAn><HV>.Q[<Ws>, <offs>]
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> For the "8-bit" variant: is the slice index offset, in the range 0 to 15, encoded in the "off4" field.
For the "16-bit" variant: is the slice index offset, in the range 0 to 7, encoded in the "off3" field.
For the "32-bit" variant: is the slice index offset, in the range 0 to 3, encoded in the "off2" field.
For the "64-bit" variant: is the slice index offset, in the range 0 to 1, encoded in the "o1" field.
For the "128-bit" variant: is the slice index offset, with implicit value 0.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.
For the "128-bit" variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAn" field.

Operation

The description of MOVA (tile to vector, single) gives the operational pseudocode for this instruction.

Operational Information

The description of MOVA (tile to vector, single) gives the operational information for this instruction.

MOV (tile to vector, two registers)

Move ZA two-slice operand to Z two-vector operand

This instruction operates on a horizontal or vertical ZA two-slice operand within a ZA tile of the specified element size.
The first slice of the two-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 2, modulo the number of slices in the tile.
The immediate offset is a multiple of 2 in the range 0 to the number of elements in a 128-bit vector segment minus 2.
This instruction is unpredicated.

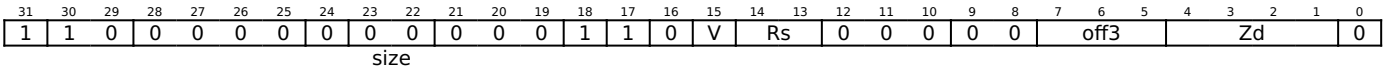
This is an alias of MOVA (tile to vector, two registers). This means:

- The encodings in this description are named to match the encodings of MOVA (tile to vector, two registers).
- The description of MOVA (tile to vector, two registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.B-<Zd2>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs2>]
```

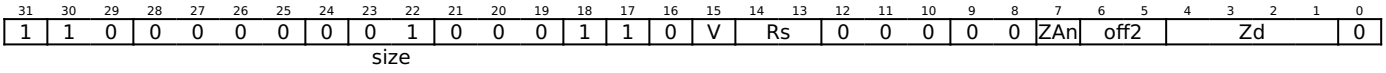
is equivalent to

```
MOVA { <Zd1>.B-<Zd2>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs2>]
```

and is always the preferred disassembly.

16-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.H-<Zd2>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs2>]
```

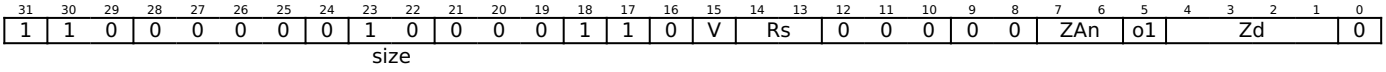
is equivalent to

```
MOVA { <Zd1>.H-<Zd2>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs2>]
```

and is always the preferred disassembly.

32-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.S-<Zd2>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs2>]
```

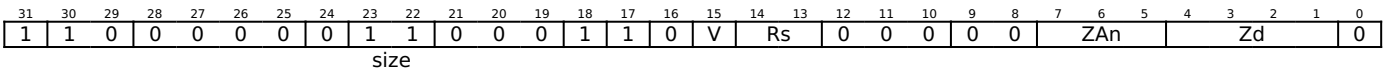
is equivalent to

```
MOVA { <Zd1>.S-<Zd2>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs2>]
```

and is always the preferred disassembly.

64-bit

(FEAT_SME2)



Encoding

```
MOV { <Zd1>.D-<Zd2>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs2>]
```

is equivalent to

```
MOVA { <Zd1>.D-<Zd2>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs2>]
```

and is always the preferred disassembly.

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off3" field times 2.
For the "16-bit" variant: is the first slice index offset, encoded as "off2" field times 2.
For the "32-bit" variant: is the first slice index offset, encoded as "o1" field times 2.
For the "64-bit" variant: is the first slice index offset, with implicit value 0.

<offs2> For the "8-bit" variant: is the second slice index offset, encoded as "off3" field times 2 plus 1.
For the "16-bit" variant: is the second slice index offset, encoded as "off2" field times 2 plus 1.
For the "32-bit" variant: is the second slice index offset, encoded as "o1" field times 2 plus 1.
For the "64-bit" variant: is the second slice index offset, with implicit value 1.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

The description of MOVA (tile to vector, two registers) gives the operational pseudocode for this instruction.

Operational Information

The description of MOVA (tile to vector, two registers) gives the operational information for this instruction.

MOV (vector to array, four registers)

Move Z four-vector operand to four ZA single-vector groups

This instruction operates on four ZA single-vector groups.
The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.
The vector group symbol VGx4 indicates that the instruction operates on four ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.

This is an alias of MOVA (vector to array, four registers). This means:

- The encodings in this description are named to match the encodings of MOVA (vector to array, four registers).
- The description of MOVA (vector to array, four registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SME2

(FEAT_SME2)

Encoding

```
MOV ZA.D[<Wv>, <offs>{, VGx4}], { <Zn1>.D-<Zn4>.D }
```

is equivalent to

```
MOVA ZA.D[<Wv>, <offs>{, VGx4}], { <Zn1>.D-<Zn4>.D }
```

and is always the preferred disassembly.

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.
<Zn4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

The description of MOVA (vector to array, four registers) gives the operational pseudocode for this instruction.

Operational Information

The description of MOVA (vector to array, four registers) gives the operational information for this instruction.

MOV (vector to tile, four registers)

Move Z four-vector operand to ZA four-slice operand

This instruction operates on a horizontal or vertical ZA four-slice operand within a ZA tile of the specified element size.
The first slice of the four-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 4, modulo the number of slices in the tile.
The immediate offset is a multiple of 4 in the range 0 to the number of elements in a 128-bit vector segment minus 4.
This instruction is unpredicated.

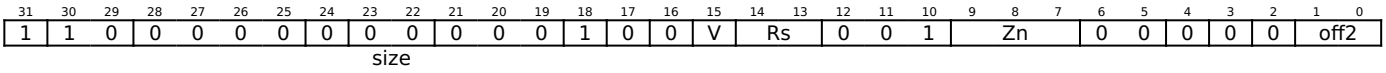
This is an alias of MOVA (vector to tile, four registers). This means:

- The encodings in this description are named to match the encodings of MOVA (vector to tile, four registers).
- The description of MOVA (vector to tile, four registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

```
MOV ZA0<HV>.B[<Ws>, <offs1>:<offs4>], { <Zn1>.B-<Zn4>.B }
```

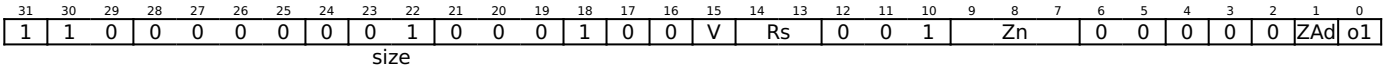
is equivalent to

```
MOVA ZA0<HV>.B[<Ws>, <offs1>:<offs4>], { <Zn1>.B-<Zn4>.B }
```

and is always the preferred disassembly.

16-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.H[<Ws>, <offs1>:<offs4>], { <Zn1>.H-<Zn4>.H }
```

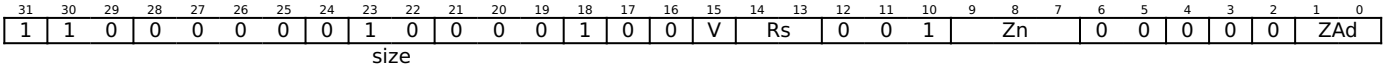
is equivalent to

```
MOVA <ZAd><HV>.H[<Ws>, <offs1>:<offs4>], { <Zn1>.H-<Zn4>.H }
```

and is always the preferred disassembly.

32-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.S[<Ws>, <offs1>:<offs4>], { <Zn1>.S-<Zn4>.S }
```

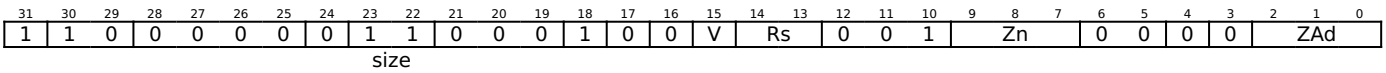
is equivalent to

```
MOVA <ZAd><HV>.S[<Ws>, <offs1>:<offs4>], { <Zn1>.S-<Zn4>.S }
```

and is always the preferred disassembly.

64-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.D[<Ws>, <offs1>:<offs4>], { <Zn1>.D-<Zn4>.D }
```

is equivalent to

```
MOVA <ZAd><HV>.D[<Ws>, <offs1>:<offs4>], { <Zn1>.D-<Zn4>.D }
```

and is always the preferred disassembly.

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off2" field times 4.
For the "16-bit" variant: is the first slice index offset, encoded as "o1" field times 4.
For the "32-bit" and "64-bit" variants: is the first slice index offset, with implicit value 0.

<offs4> For the "8-bit" variant: is the fourth slice index offset, encoded as "off2" field times 4 plus 3.
For the "16-bit" variant: is the fourth slice index offset, encoded as "o1" field times 4 plus 3.
For the "32-bit" and "64-bit" variants: is the fourth slice index offset, with implicit value 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.

Operation

MOV (vector to tile, single)

Move Z vector to ZA tile slice

This instruction operates on individual horizontal or vertical slices within a named ZA tile of the specified element size. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of such elements in a vector. The immediate offset is in the range 0 to the number of elements in a 128-bit vector segment minus 1. Inactive elements in the destination slice remain unmodified.

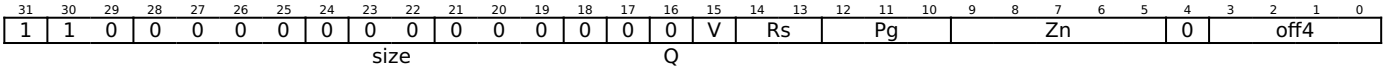
This is an alias of MOVA (vector to tile, single). This means:

- The encodings in this description are named to match the encodings of MOVA (vector to tile, single).
- The description of MOVA (vector to tile, single) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 5 classes: 8-bit , 16-bit , 32-bit , 64-bit and 128-bit

8-bit

(FEAT_SME)



Encoding

```
MOV ZA0<HV>.B[<Ws>, <offs>], <Pg>/M, <Zn>.B
```

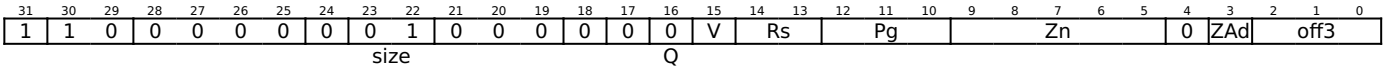
is equivalent to

```
MOVA ZA0<HV>.B[<Ws>, <offs>], <Pg>/M, <Zn>.B
```

and is always the preferred disassembly.

16-bit

(FEAT_SME)



Encoding

```
MOV <ZAd><HV>.H[<Ws>, <offs>], <Pg>/M, <Zn>.H
```

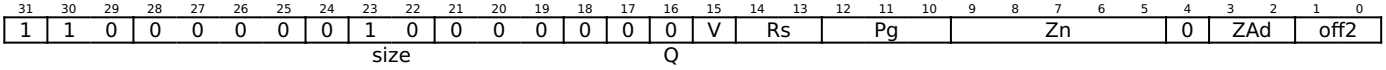
is equivalent to

```
MOVA <ZAd><HV>.H[<Ws>, <offs>], <Pg>/M, <Zn>.H
```

and is always the preferred disassembly.

32-bit

(FEAT_SME)



Encoding

```
MOV <ZAd><HV>.S[<Ws>, <offs>], <Pg>/M, <Zn>.S
```

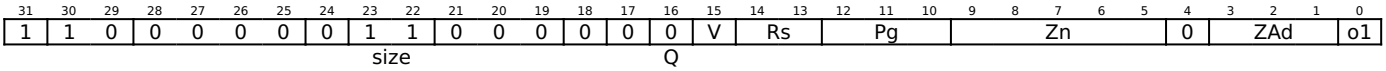
is equivalent to

```
MOVA <ZAd><HV>.S[<Ws>, <offs>], <Pg>/M, <Zn>.S
```

and is always the preferred disassembly.

64-bit

(FEAT_SME)



Encoding

```
MOV <ZAd><HV>.D[<Ws>, <offs>], <Pg>/M, <Zn>.D
```

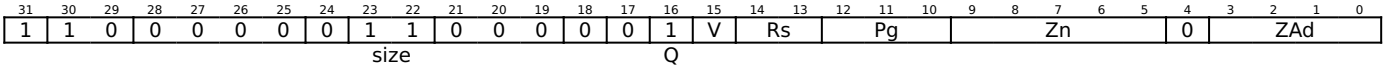
is equivalent to

```
MOVA <ZAd><HV>.D[<Ws>, <offs>], <Pg>/M, <Zn>.D
```

and is always the preferred disassembly.

128-bit

(FEAT_SME)



Encoding

```
MOV <ZAd><HV>.Q[<Ws>, <offs>], <Pg>/M, <Zn>.Q
```

is equivalent to

```
MOVA <ZAd><HV>.Q[<Ws>, <offs>], <Pg>/M, <Zn>.Q
```

and is always the preferred disassembly.

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> For the "8-bit" variant: is the slice index offset, in the range 0 to 15, encoded in the "off4" field.
For the "16-bit" variant: is the slice index offset, in the range 0 to 7, encoded in the "off3" field.
For the "32-bit" variant: is the slice index offset, in the range 0 to 3, encoded in the "off2" field.
For the "64-bit" variant: is the slice index offset, in the range 0 to 1, encoded in the "o1" field.
For the "128-bit" variant: is the slice index offset, with implicit value 0.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.
For the "128-bit" variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAd" field.

Operation

The description of MOVA (vector to tile, single) gives the operational pseudocode for this instruction.

Operational Information

The description of MOVA (vector to tile, single) gives the operational information for this instruction.

MOV (vector to tile, two registers)

Move Z two-vector operand to ZA two-slice operand

This instruction operates on a horizontal or vertical ZA two-slice operand within a ZA tile of the specified element size.
The first slice of the two-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 2, modulo the number of slices in the tile.
The immediate offset is a multiple of 2 in the range 0 to the number of elements in a 128-bit vector segment minus 2.
This instruction is unpredicated.

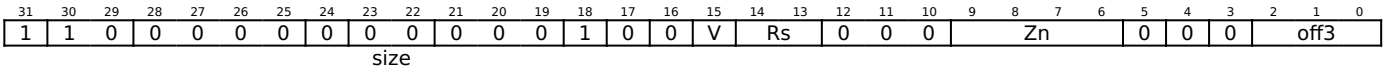
This is an alias of MOVA (vector to tile, two registers). This means:

- The encodings in this description are named to match the encodings of MOVA (vector to tile, two registers).
- The description of MOVA (vector to tile, two registers) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

```
MOV ZA0<HV>.B[<Ws>, <offs1>:<offs2>], { <Zn1>.B-<Zn2>.B }
```

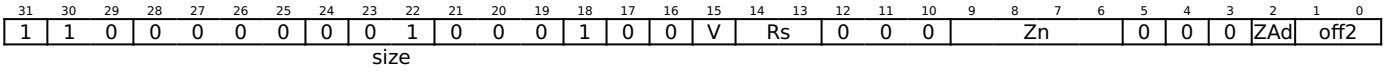
is equivalent to

```
MOVA ZA0<HV>.B[<Ws>, <offs1>:<offs2>], { <Zn1>.B-<Zn2>.B }
```

and is always the preferred disassembly.

16-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.H[<Ws>, <offs1>:<offs2>], { <Zn1>.H-<Zn2>.H }
```

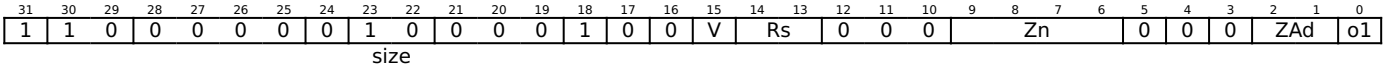
is equivalent to

```
MOVA <ZAd><HV>.H[<Ws>, <offs1>:<offs2>], { <Zn1>.H-<Zn2>.H }
```

and is always the preferred disassembly.

32-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.S[<Ws>, <offs1>:<offs2>], { <Zn1>.S-<Zn2>.S }
```

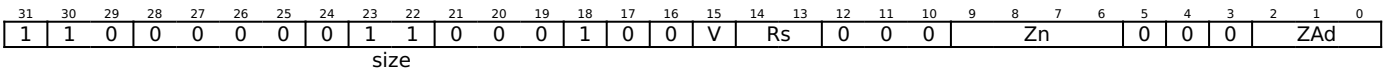
is equivalent to

```
MOVA <ZAd><HV>.S[<Ws>, <offs1>:<offs2>], { <Zn1>.S-<Zn2>.S }
```

and is always the preferred disassembly.

64-bit

(FEAT_SME2)



Encoding

```
MOV <ZAd><HV>.D[<Ws>, <offs1>:<offs2>], { <Zn1>.D-<Zn2>.D }
```

is equivalent to

```
MOVA <ZAd><HV>.D[<Ws>, <offs1>:<offs2>], { <Zn1>.D-<Zn2>.D }
```

and is always the preferred disassembly.

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off3" field times 2.
For the "16-bit" variant: is the first slice index offset, encoded as "off2" field times 2.
For the "32-bit" variant: is the first slice index offset, encoded as "o1" field times 2.
For the "64-bit" variant: is the first slice index offset, with implicit value 0.

<offs2> For the "8-bit" variant: is the second slice index offset, encoded as "off3" field times 2 plus 1.
For the "16-bit" variant: is the second slice index offset, encoded as "off2" field times 2 plus 1.
For the "32-bit" variant: is the second slice index offset, encoded as "o1" field times 2 plus 1.
For the "64-bit" variant: is the second slice index offset, with implicit value 1.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.

Operation

MOVA (array to vector, four registers)

Move four ZA single-vector groups to Z four-vector operand

This instruction operates on four ZA single-vector groups.
The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.
The vector group symbol VGx4 indicates that the instruction operates on four ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.
This instruction is used by the alias MOV (array to vector, four registers).

SME2

(FEAT_SME2)

Encoding

```
MOVA { <Zd1>.D-<Zd4>.D }, ZA.D[<Wv>, <offs>{, VGx4}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAvector{VL}(vec);
    Z{VL}(d + r) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVA (array to vector, two registers)

Move two ZA single-vector groups to Z two-vector operand

This instruction operates on two ZA single-vector groups.
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.
The vector group symbol VGx2 indicates that the instruction operates on two ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.
This instruction is used by the alias MOV (array to vector, two registers).

SME2

(FEAT_SME2)

Encoding

```
MOVA { <Zd1>.D-<Zd2>.D }, ZA.D[<Wv>, <offs>{, VGx2}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAvector{VL}(vec);
    Z{VL}(d + r) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

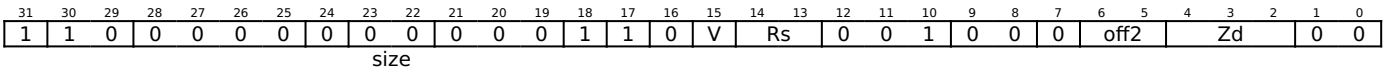
MOVA (tile to vector, four registers)

Move ZA four-slice operand to Z four-vector operand

This instruction operates on a horizontal or vertical ZA four-slice operand within a ZA tile of the specified element size.
The first slice of the four-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 4, modulo the number of slices in the tile.
The immediate offset is a multiple of 4 in the range 0 to the number of elements in a 128-bit vector segment minus 4.
This instruction is unpredicated.
This instruction is used by the alias MOV (tile to vector, four registers).
It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

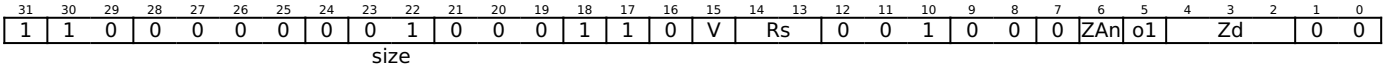
```
MOVA { <Zd1>.B-<Zd4>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 8;
let d : integer = UInt(Zd::'00');
let n : integer = 0;
let offset : integer = UInt(off2::'00');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2)



Encoding

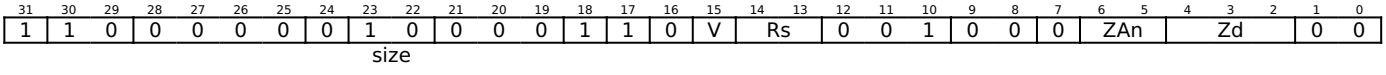
```
MOVA { <Zd1>.H-<Zd4>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = UInt(o1::'00');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2)



Encoding

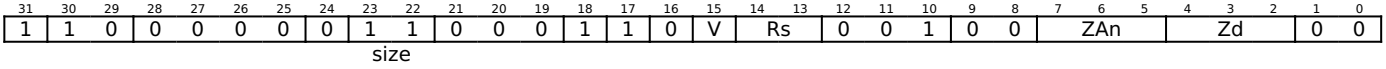
```
MOVA { <Zd1>.S-<Zd4>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 32;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2)



Encoding

```
MOVA { <Zd1>.D-<Zd4>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 256 then
    EndOfDecode(Decode_UNDEF);
end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 64;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off2" field times 4.
For the "16-bit" variant: is the first slice index offset, encoded as "o1" field times 4.
For the "32-bit" and "64-bit" variants: is the first slice index offset, with implicit value 0.

<offs4> For the "8-bit" variant: is the fourth slice index offset, encoded as "off2" field times 4 plus 3.
For the "16-bit" variant: is the fourth slice index offset, encoded as "o1" field times 4 plus 3.
For the "32-bit" and "64-bit" variants: is the fourth slice index offset, with implicit value 3.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAslice{VL}(n, esize, vertical, slice + r);
    Z{VL}(d + r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVA (tile to vector, single)

Move ZA tile slice to Z vector

This instruction operates on individual horizontal or vertical slices within a named ZA tile of the specified element size. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of such elements in a vector. The immediate offset is in the range 0 to the number of elements in a 128-bit vector segment minus 1.

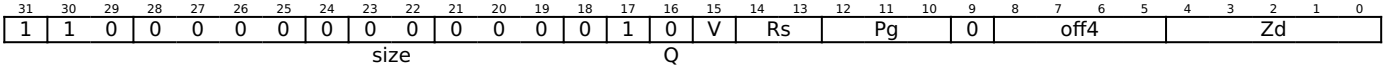
Inactive elements in the destination vector remain unmodified.

This instruction is used by the alias MOV (tile to vector, single).

It has encodings from 5 classes: 8-bit , 16-bit , 32-bit , 64-bit and 128-bit

8-bit

(FEAT_SME)



Encoding

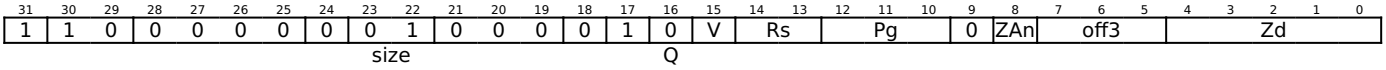
```
MOVA <Zd>.B, <Pg>/M, ZA0<HV>.B[<Ws>, <offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = 0;
let offset : integer = UInt(off4);
let esize : integer{} = 8;
let d : integer = UInt(Zd);
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME)



Encoding

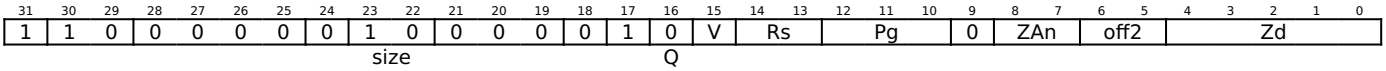
```
MOVA <Zd>.H, <Pg>/M, <ZAn><HV>.H[<Ws>, <offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(ZAn);
let offset : integer = UInt(off3);
let esize : integer{} = 16;
let d : integer = UInt(Zd);
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME)



Encoding

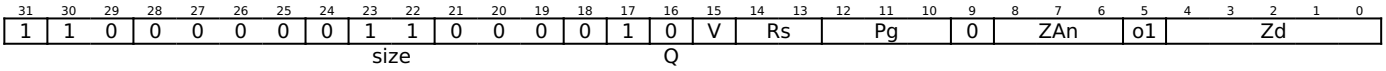
```
MOVA <Zd>.S, <Pg>/M, <ZAn><HV>.S[<Ws>, <offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(ZAn);
let offset : integer = UInt(off2);
let esize : integer{} = 32;
let d : integer = UInt(Zd);
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME)



Encoding

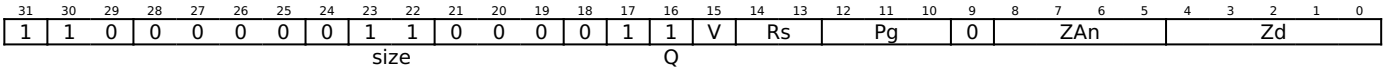
```
MOVA <Zd>.D, <Pg>/M, <ZAn><HV>.D[<Ws>, <offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(ZAn);
let offset : integer = UInt(o1);
let esize : integer{} = 64;
let d : integer = UInt(Zd);
let vertical : boolean = V == '1';
```

128-bit

(FEAT_SME)



Encoding

```
MOVA <Zd>.Q, <Pg>/M, <ZAn><HV>.Q[<Ws>, <offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(ZAn);
let offset : integer = 0;
let esize : integer{} = 128;
let d : integer = UInt(Zd);
let vertical : boolean = V == '1';
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> For the "8-bit" variant: is the slice index offset, in the range 0 to 15, encoded in the "off4" field.
For the "16-bit" variant: is the slice index offset, in the range 0 to 7, encoded in the "off3" field.
For the "32-bit" variant: is the slice index offset, in the range 0 to 3, encoded in the "off2" field.
For the "64-bit" variant: is the slice index offset, in the range 0 to 1, encoded in the "o1" field.
For the "128-bit" variant: is the slice index offset, with implicit value 0.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.
For the "128-bit" variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer = VL DIV esize;
let mask : bits(PL) = P{PL}(g);
let index : bits(32) = X{32}(s);
let slice : integer = (UInt(index) + offset) MOD dim;
let operand : bits(VL) = ZAslice{VL}(n, esize, vertical, slice);
var result : bits(VL) = Z{VL}(d);

for e = 0 to dim-1 do
    let element : bits(esize) = operand[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element;
    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

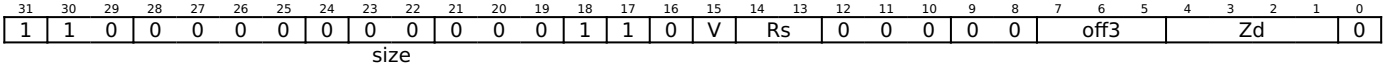
MOVA (tile to vector, two registers)

Move ZA two-slice operand to Z two-vector operand

This instruction operates on a horizontal or vertical ZA two-slice operand within a ZA tile of the specified element size.
The first slice of the two-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 2, modulo the number of slices in the tile.
The immediate offset is a multiple of 2 in the range 0 to the number of elements in a 128-bit vector segment minus 2.
This instruction is unpredicated.
This instruction is used by the alias MOV (tile to vector, two registers).
It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

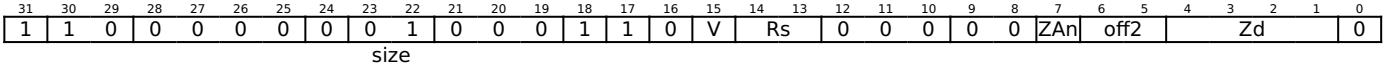
```
MOVA { <Zd1>.B-<Zd2>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 8;
let d : integer = UInt(Zd::'0');
let n : integer = 0;
let offset : integer = UInt(off3::'0');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2)



Encoding

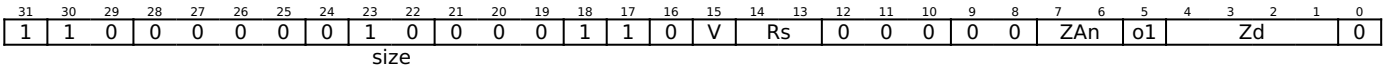
```
MOVA { <Zd1>.H-<Zd2>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = UInt(off2::'0');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2)



Encoding

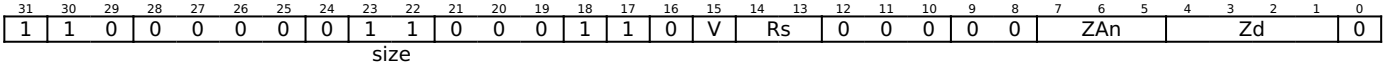
```
MOVA { <Zd1>.S-<Zd2>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 32;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = UInt(o1::'0');
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2)



Encoding

```
MOVA { <Zd1>.D-<Zd2>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 64;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off3" field times 2.
For the "16-bit" variant: is the first slice index offset, encoded as "off2" field times 2.
For the "32-bit" variant: is the first slice index offset, encoded as "o1" field times 2.
For the "64-bit" variant: is the first slice index offset, with implicit value 0.

<offs2> For the "8-bit" variant: is the second slice index offset, encoded as "off3" field times 2 plus 1.
For the "16-bit" variant: is the second slice index offset, encoded as "off2" field times 2 plus 1.
For the "32-bit" variant: is the second slice index offset, encoded as "o1" field times 2 plus 1.
For the "64-bit" variant: is the second slice index offset, with implicit value 1.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAslice{VL}(n, esize, vertical, slice + r);
    Z{VL}(d + r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVA (vector to array, four registers)

Move Z four-vector operand to four ZA single-vector groups

This instruction operates on four ZA single-vector groups.
The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.
The vector group symbol VGx4 indicates that the instruction operates on four ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.
This instruction is used by the alias MOV (vector to array, four registers).

SME2

(FEAT_SME2)

Encoding

```
MOVA ZA.D[<Wv>, <offs>{, VGx4}], { <Zn1>.D-<Zn4>.D }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let n : integer = UInt(Zn::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.
<Zn4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = Z{VL}(n + r);
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVA (vector to array, two registers)

Move Z two-vector operand to two ZA single-vector groups

This instruction operates on two ZA single-vector groups.
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.
The vector group symbol VGx2 indicates that the instruction operates on two ZA single-vector groups.
The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.
This instruction is unpredicated.
This instruction is used by the alias MOV (vector to array, two registers).

SME2

(FEAT_SME2)

Encoding

```
MOVA ZA.D[<Wv>, <offs>{, VGx2}], { <Zn1>.D-<Zn2>.D }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let n : integer = UInt(Zn::'0');
let nreg : integer{} = 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = Z{VL}(n + r);
    ZAvector{VL}(vec) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

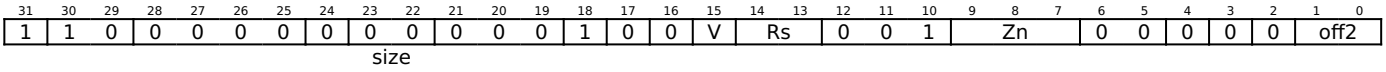
MOVA (vector to tile, four registers)

Move Z four-vector operand to ZA four-slice operand

This instruction operates on a horizontal or vertical ZA four-slice operand within a ZA tile of the specified element size.
The first slice of the four-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 4, modulo the number of slices in the tile.
The immediate offset is a multiple of 4 in the range 0 to the number of elements in a 128-bit vector segment minus 4.
This instruction is unpredicated.
This instruction is used by the alias MOV (vector to tile, four registers).
It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

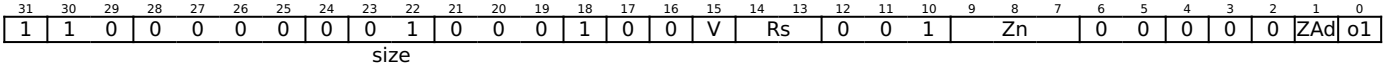
```
MOVA ZA0<HV>.B[<Ws>, <offs1>:<offs4>], { <Zn1>.B-<Zn4>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 8;
let n : integer = UInt(Zn::'00');
let d : integer = 0;
let offset : integer = UInt(off2::'00');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2)



Encoding

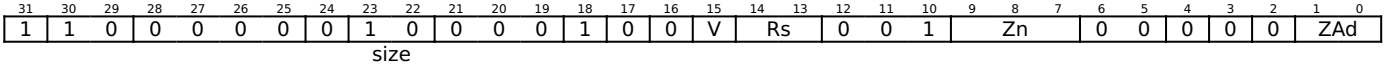
```
MOVA <ZAd><HV>.H[<Ws>, <offs1>:<offs4>], { <Zn1>.H-<Zn4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(ZAd);
let offset : integer = UInt(o1::'00');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2)



Encoding

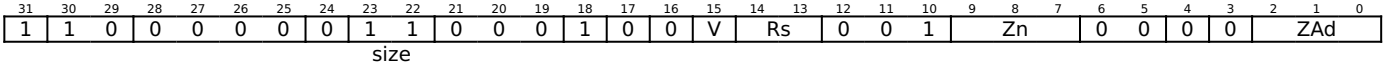
```
MOVA <ZAd><HV>.S[<Ws>, <offs1>:<offs4>], { <Zn1>.S-<Zn4>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(ZAd);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2)



Encoding

```
MOVA <ZAd><HV>.D[<Ws>, <offs1>:<offs4>], { <Zn1>.D-<Zn4>.D }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 256 then
    EndOfDecode(Decode_UNDEF);
end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 64;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(ZAd);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off2" field times 4.
For the "16-bit" variant: is the first slice index offset, encoded as "o1" field times 4.
For the "32-bit" and "64-bit" variants: is the first slice index offset, with implicit value 0.

<offs4> For the "8-bit" variant: is the fourth slice index offset, encoded as "off2" field times 4 plus 3.
For the "16-bit" variant: is the fourth slice index offset, encoded as "o1" field times 4 plus 3.
For the "32-bit" and "64-bit" variants: is the fourth slice index offset, with implicit value 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = Z{VL}(n + r);
    ZAslice{VL}(d, esize, vertical, slice + r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVA (vector to tile, single)

Move Z vector to ZA tile slice

This instruction operates on individual horizontal or vertical slices within a named ZA tile of the specified element size. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of such elements in a vector. The immediate offset is in the range 0 to the number of elements in a 128-bit vector segment minus 1.

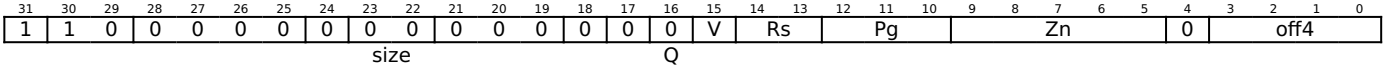
Inactive elements in the destination slice remain unmodified.

This instruction is used by the alias MOV (vector to tile, single).

It has encodings from 5 classes: 8-bit , 16-bit , 32-bit , 64-bit and 128-bit

8-bit

(FEAT_SME)



Encoding

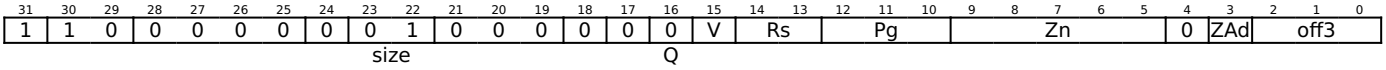
```
MOVA ZA0<HV>.B[<Ws>, <offs>], <Pg>/M, <Zn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(Zn);
let d : integer = 0;
let offset : integer = UInt(off4);
let esize : integer{} = 8;
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME)



Encoding

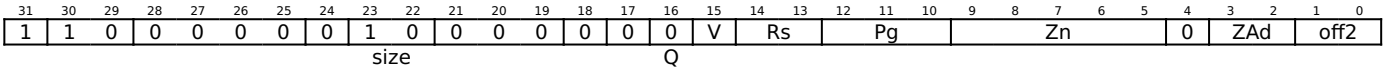
```
MOVA <ZAd><HV>.H[<Ws>, <offs>], <Pg>/M, <Zn>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(Zn);
let d : integer = UInt(ZAd);
let offset : integer = UInt(off3);
let esize : integer{} = 16;
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME)



Encoding

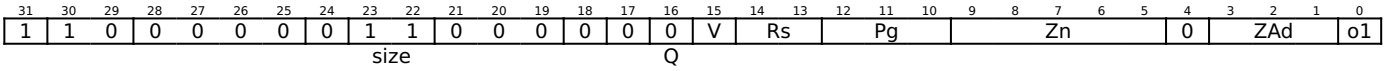
```
MOVA <ZAd><HV>.S[<Ws>, <offs>], <Pg>/M, <Zn>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(Zn);
let d : integer = UInt(ZAd);
let offset : integer = UInt(off2);
let esize : integer{} = 32;
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME)



Encoding

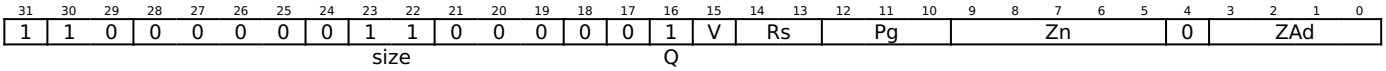
```
MOVA <ZAd><HV>.D[<Ws>, <offs>], <Pg>/M, <Zn>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(Zn);
let d : integer = UInt(ZAd);
let offset : integer = UInt(o1);
let esize : integer{} = 64;
let vertical : boolean = V == '1';
```

128-bit

(FEAT_SME)



Encoding

```
MOVA <ZAd><HV>.Q[<Ws>, <offs>], <Pg>/M, <Zn>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let s : integer = UInt('011'::Rs);
let n : integer = UInt(Zn);
let d : integer = UInt(ZAd);
let offset : integer = 0;
let esize : integer{} = 128;
let vertical : boolean = V == '1';
```

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> For the "8-bit" variant: is the slice index offset, in the range 0 to 15, encoded in the "off4" field.
For the "16-bit" variant: is the slice index offset, in the range 0 to 7, encoded in the "off3" field.
For the "32-bit" variant: is the slice index offset, in the range 0 to 3, encoded in the "off2" field.
For the "64-bit" variant: is the slice index offset, in the range 0 to 1, encoded in the "o1" field.
For the "128-bit" variant: is the slice index offset, with implicit value 0.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.
For the "128-bit" variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAd" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer = VL DIV esize;
let mask : bits(PL) = P{PL}(g);
let operand : bits(VL) = Z{VL}(n);
let index : bits(32) = X{32}(s);
let slice : integer = (UInt(index) + offset) MOD dim;
var result : bits(VL) = ZAslice{VL}(d, esize, vertical, slice);

for e = 0 to dim-1 do
    let element : bits(esize) = operand[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element;
    end;
end;

ZAslice{VL}(d, esize, vertical, slice) = result;
```

Operational information

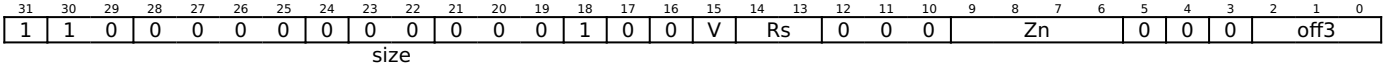
MOVA (vector to tile, two registers)

Move Z two-vector operand to ZA two-slice operand

This instruction operates on a horizontal or vertical ZA two-slice operand within a ZA tile of the specified element size.
The first slice of the two-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 2, modulo the number of slices in the tile.
The immediate offset is a multiple of 2 in the range 0 to the number of elements in a 128-bit vector segment minus 2.
This instruction is unpredicated.
This instruction is used by the alias MOV (vector to tile, two registers).
It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2)



Encoding

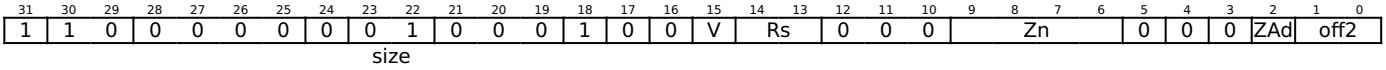
```
MOVA ZA0<HV>.B[<Ws>, <offs1>:<offs2>], { <Zn1>.B-<Zn2>.B }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 8;
let n : integer = UInt(Zn::'0');
let d : integer = 0;
let offset : integer = UInt(off3::'0');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2)



Encoding

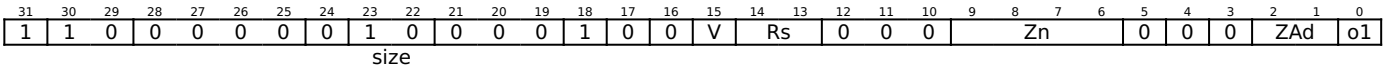
```
MOVA <ZAd><HV>.H[<Ws>, <offs1>:<offs2>], { <Zn1>.H-<Zn2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(ZAd);
let offset : integer = UInt(off2::'0');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2)



Encoding

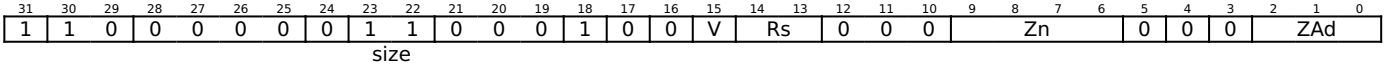
```
MOVA <ZAd><HV>.S[<Ws>, <offs1>:<offs2>], { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(ZAd);
let offset : integer = UInt(o1::'0');
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2)



Encoding

```
MOVA <ZAd><HV>.D[<Ws>, <offs1>:<offs2>], { <Zn1>.D-<Zn2>.D }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 64;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(ZAd);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off3" field times 2.
For the "16-bit" variant: is the first slice index offset, encoded as "off2" field times 2.
For the "32-bit" variant: is the first slice index offset, encoded as "o1" field times 2.
For the "64-bit" variant: is the first slice index offset, with implicit value 0.

<offs2> For the "8-bit" variant: is the second slice index offset, encoded as "off3" field times 2 plus 1.
For the "16-bit" variant: is the second slice index offset, encoded as "off2" field times 2 plus 1.
For the "32-bit" variant: is the second slice index offset, encoded as "o1" field times 2 plus 1.
For the "64-bit" variant: is the second slice index offset, with implicit value 1.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

<ZAd> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAd" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAd" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAd" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = Z{VL}(n + r);
    ZAslice{VL}(d, esize, vertical, slice + r) = result;
end;
```

Operational information

MOVAZ (array to vector, four registers)

Move and zero four ZA single-vector groups to Z four-vector operand

This instruction operates on four ZA single-vector groups. The ZA single-vector groups are zeroed after moving their contents to the destination vectors.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the instruction operates on four ZA single-vector groups.

The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2p1)

Encoding

```
MOVAZ { <Zd1>.D-<Zd4>.D }, ZA.D[<Wv>, <offs>{, VGx4}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAvector{VL}(vec);
    ZAvector{VL}(vec) = Zeros{VL};
    Z{VL}(d + r) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVAZ (array to vector, two registers)

Move and zero two ZA single-vector groups to Z two-vector operand

This instruction operates on two ZA single-vector groups. The ZA single-vector groups are zeroed after moving their contents to the destination vectors.

The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

The vector group symbol VGx2 indicates that the instruction operates on two ZA single-vector groups.

The preferred disassembly syntax uses a 64-bit element size, but an assembler should accept any element size if it is used consistently for all operands. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2p1)

Encoding

```
MOVAZ { <Zd1>.D-<Zd2>.D }, ZA.D[<Wv>, <offs>{, VGx2}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let offset : integer = UInt(off3);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAvector{VL}(vec);
    ZAvector{VL}(vec) = Zeros{VL};
    Z{VL}(d + r) = result;
    vec = vec + vstride;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVAZ (tile to vector, four registers)

Move and zero ZA four-slice operand to Z four-vector operand

This instruction operates on a horizontal or vertical ZA four-slice operand within a ZA tile of the specified element size. The tile slices are zeroed after moving their contents to the destination vectors.

The first slice of the four-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 4, modulo the number of slices in the tile.

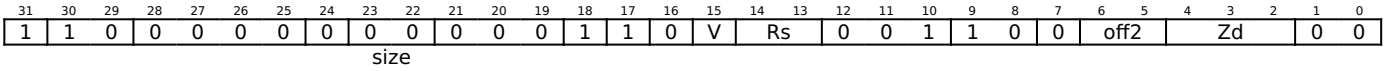
The immediate offset is a multiple of 4 in the range 0 to the number of elements in a 128-bit vector segment minus 4.

This instruction is unpredicated.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2p1)



Encoding

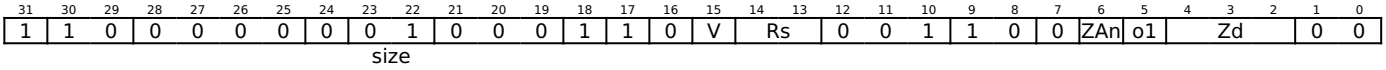
```
MOVAZ { <Zd1>.B-<Zd4>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 8;
let d : integer = UInt(Zd::'00');
let n : integer = 0;
let offset : integer = UInt(off2::'00');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2p1)



Encoding

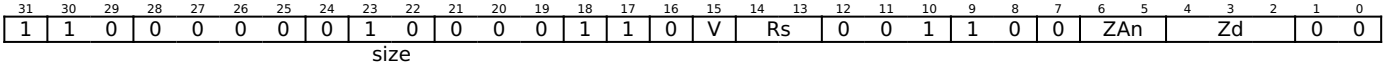
```
MOVAZ { <Zd1>.H-<Zd4>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = UInt(o1::'00');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2p1)



Encoding

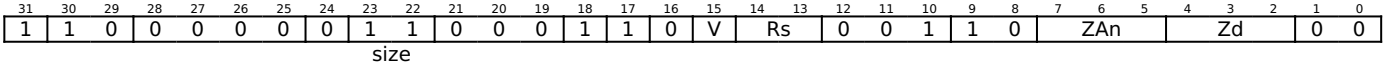
```
MOVAZ { <Zd1>.S-<Zd4>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 4;
let esize : integer{} = 32;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2p1)



Encoding

```
MOVAZ { <Zd1>.D-<Zd4>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedSVL() < 256 then
    EndOfDecode(Decode_UNDEF);
end;
let s : integer = UInt('011'::Rs);

let esize : integer{} = 64;
let d : integer = UInt(Zd::'00');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off2" field times 4.
For the "16-bit" variant: is the first slice index offset, encoded as "o1" field times 4.
For the "32-bit" and "64-bit" variants: is the first slice index offset, with implicit value 0.

<offs4> For the "8-bit" variant: is the fourth slice index offset, encoded as "off2" field times 4 plus 3.
For the "16-bit" variant: is the fourth slice index offset, encoded as "o1" field times 4 plus 3.
For the "32-bit" and "64-bit" variants: is the fourth slice index offset, with implicit value 3.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAslice{VL}(n, esize, vertical, slice + r);
    ZAslice{VL}(n, esize, vertical, slice + r) = Zeros{VL};
    Z{VL}(d + r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> For the "8-bit" variant: is the slice index offset, in the range 0 to 15, encoded in the "off4" field.
For the "16-bit" variant: is the slice index offset, in the range 0 to 7, encoded in the "off3" field.
For the "32-bit" variant: is the slice index offset, in the range 0 to 3, encoded in the "off2" field.
For the "64-bit" variant: is the slice index offset, in the range 0 to 1, encoded in the "o1" field.
For the "128-bit" variant: is the slice index offset, with implicit value 0.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.
For the "128-bit" variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let dim : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = (UInt(index) + offset) MOD dim;
let operand : bits(VL) = ZAslice{VL}(n, esize, vertical, slice);
ZAslice{VL}(n, esize, vertical, slice) = Zeros{VL};
Z{VL}(d) = operand;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVAZ (tile to vector, two registers)

Move and zero ZA two-slice operand to Z two-vector operand

This instruction operates on a horizontal or vertical ZA two-slice operand within a ZA tile of the specified element size. The tile slices are zeroed after moving their contents to the destination vectors.

The first slice of the two-slice operand is selected by rounding down the sum of the slice index register and the immediate offset to the nearest lower multiple of 2, modulo the number of slices in the tile.

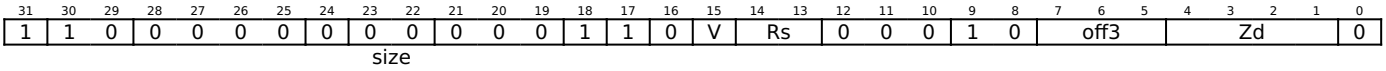
The immediate offset is a multiple of 2 in the range 0 to the number of elements in a 128-bit vector segment minus 2.

This instruction is unpredicated.

It has encodings from 4 classes: 8-bit , 16-bit , 32-bit and 64-bit

8-bit

(FEAT_SME2p1)



Encoding

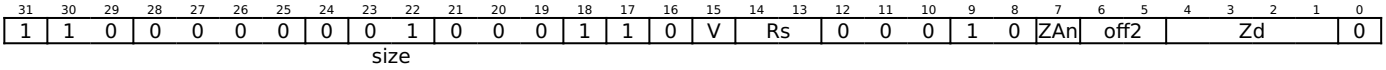
```
MOVAZ { <Zd1>.B-<Zd2>.B }, ZA0<HV>.B[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 8;
let d : integer = UInt(Zd::'0');
let n : integer = 0;
let offset : integer = UInt(off3::'0');
let vertical : boolean = V == '1';
```

16-bit

(FEAT_SME2p1)



Encoding

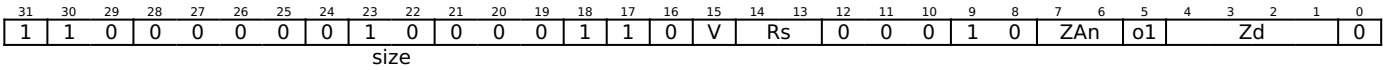
```
MOVAZ { <Zd1>.H-<Zd2>.H }, <ZAn><HV>.H[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 16;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = UInt(off2::'0');
let vertical : boolean = V == '1';
```

32-bit

(FEAT_SME2p1)



Encoding

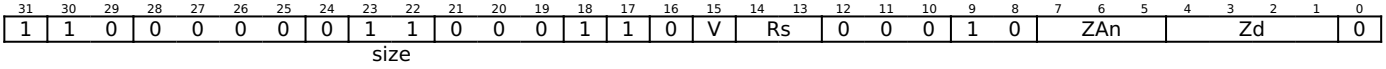
```
MOVAZ { <Zd1>.S-<Zd2>.S }, <ZAn><HV>.S[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 32;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = UInt(o1::'0');
let vertical : boolean = V == '1';
```

64-bit

(FEAT_SME2p1)



Encoding

```
MOVAZ { <Zd1>.D-<Zd2>.D }, <ZAn><HV>.D[<Ws>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF); end;
let s : integer = UInt('011'::Rs);
let nreg : integer{} = 2;
let esize : integer{} = 64;
let d : integer = UInt(Zd::'0');
let n : integer = UInt(ZAn);
let offset : integer = 0;
let vertical : boolean = V == '1';
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs1> For the "8-bit" variant: is the first slice index offset, encoded as "off3" field times 2.
For the "16-bit" variant: is the first slice index offset, encoded as "off2" field times 2.
For the "32-bit" variant: is the first slice index offset, encoded as "o1" field times 2.
For the "64-bit" variant: is the first slice index offset, with implicit value 0.

<offs2> For the "8-bit" variant: is the second slice index offset, encoded as "off3" field times 2 plus 1.
For the "16-bit" variant: is the second slice index offset, encoded as "off2" field times 2 plus 1.
For the "32-bit" variant: is the second slice index offset, encoded as "o1" field times 2 plus 1.
For the "64-bit" variant: is the second slice index offset, with implicit value 1.

<ZAn> For the "16-bit" variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
if nreg == 4 && esize == 64 && VL < 256 then EndOfDecode(Decode_UNDEF); end;
let slices : integer = VL DIV esize;
let index : bits(32) = X{32}(s);
let slice : integer = ((UInt(index) - UInt(index) MOD nreg) + offset) MOD slices;
for r = 0 to nreg-1 do
    let result : bits(VL) = ZAslice{VL}(n, esize, vertical, slice + r);
    ZAslice{VL}(n, esize, vertical, slice + r) = Zeros{VL};
    Z{VL}(d + r) = result;
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

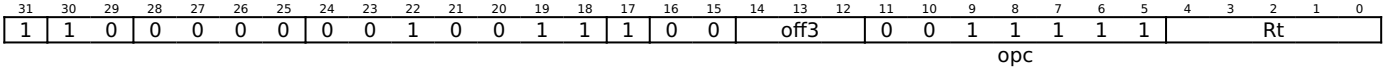
MOVT (scalar to table)

Move 8 bytes from general-purpose register to ZT0

This instruction moves 8 bytes to the ZT0 register at the byte offset specified by the immediate index from a general-purpose register. This instruction is UNDEFINED in Non-debug state.

SME2

(FEAT_SME2)



Encoding

```
MOVT ZT0[<offs>], <Xt>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !Halted() then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let offset : integer = UInt(off3);
```

Assembler Symbols

<offs>	Is the immediate byte offset, a multiple of 8 in the range of 0 to 56, encoded in the "off3" field as <offs>/8.
<Xt>	Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();
var result : bits(512) = ZT0{512}();
result[offset*:64] = X{64}(t);
ZT0{512}() = result;
```

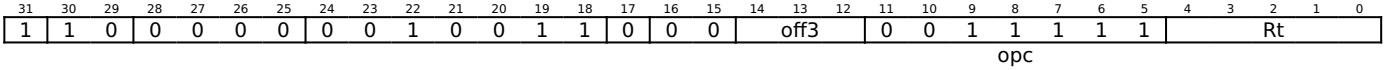
MOVT (table to scalar)

Move 8 bytes from ZT0 to general-purpose register

This instruction moves 8 bytes to a general-purpose register from the ZT0 register at the byte offset specified by the immediate index. This instruction is UNDEFINED in Non-debug state.

SME2

(FEAT_SME2)



Encoding

```
MOVT <Xt>, ZT0[<offs>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) || !Halted() then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Rt);
let offset : integer = UInt(off3);
```

Assembler Symbols

<Xt>	Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<offs>	Is the immediate byte offset, a multiple of 8 in the range of 0 to 56, encoded in the "off3" field as <offs>/8.

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();
let operand : bits(512) = ZT0{512}();
X{64}(t) = operand[offset*:64];
```

MOVT (vector to table)

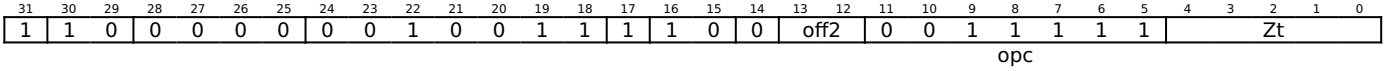
Move vector register to ZT0

This instruction copies the source vector register to ZT0 at the vector length offset specified by the immediate index. When the index is zero, the instruction writes zeros to the most significant (512-VL) bits of the ZT0 register. When the index is not zero, the unindexed portions of ZT0 remain unchanged.

This instruction is unpredicated.

SME2

(FEAT_SME_LUTv2)



Encoding

```
MOVT ZT0{[<offs>, MUL VL]}, <Zt>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_LUTv2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let imm : integer = UInt(off2);
```

Assembler Symbols

<offs>	Is the vector length offset, in the range 0 to 3, defaulting to 0 when omitted, encoded in the "off2" field.
<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

Operation

```
CheckStreamingSVEEnabled();
CheckSMEZT0Enabled();
let VL : integer{} = CurrentVL();
let tsize : integer{} = (if VL <= 512 then VL else 512) as integer{128, 256, 512};
let offset : integer = imm MOD (512 DIV tsize);
var result : bits(512) = if imm == 0 then Zeros{512} else ZT0{512}();
result[offset*:tsize] = Z{VL}(t)[tsize-1:0];
ZT0{512}() = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RDSVL

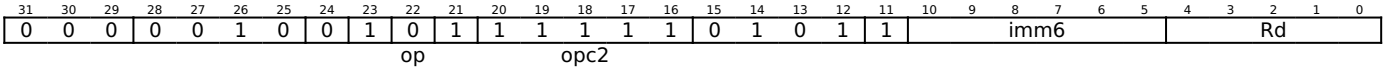
Read multiple of Streaming SVE vector register size to scalar register

This instruction multiplies the Streaming SVE vector register size in bytes by an immediate in the range -32 to 31 and places the result in the 64-bit destination general-purpose register.

This instruction does not require the PE to be in Streaming SVE mode.

SME

(FEAT_SME)



Encoding

```
RDSVL <Xd>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd>	Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSMEEnabled();
let SVL : integer = CurrentSVL();
let len : integer = imm * (SVL DIV 8);
X{64}(d) = len[63:0];
```

SCLAMP

Multi-vector signed clamp to minimum/maximum

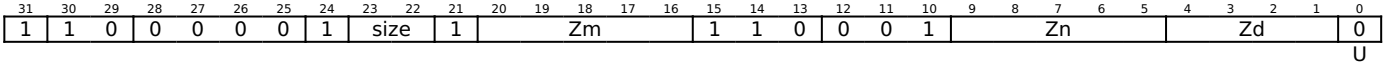
This instruction clamps each signed element in the two or four destination vectors to between the signed minimum value in the corresponding element of the first source vector and the signed maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the two or four destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

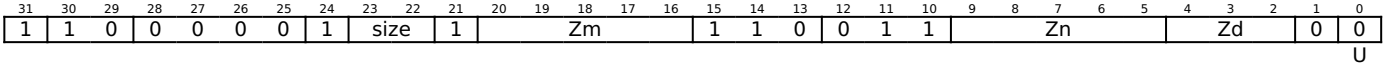
```
SCLAMP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
SCLAMP { <Zd1>.<T>-<Zd4>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n);
    let operand2 : bits(VL) = Z{VL}(m);
    let operand3 : bits(VL) = Z{VL}(d+r);
    for e = 0 to elements-1 do
        let element1 : integer = SInt(operand1[e*:esize]);
        let element2 : integer = SInt(operand2[e*:esize]);
        let element3 : integer = SInt(operand3[e*:esize]);
        let res : integer = Min(Max(element1, element3), element2);
        results[[r]][e*:esize] = res[esize-1:0];
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SCVTF

Multi-vector signed 32-bit integer convert to single-precision

This instruction converts each element of the two or four source vectors from signed 32-bit integer to single-precision, and places the results in the corresponding elements of the two or four destination vectors.

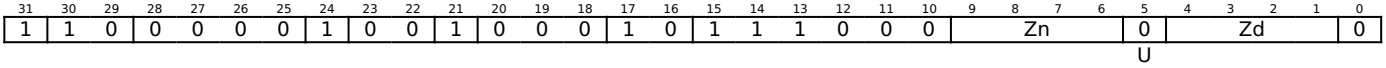
This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

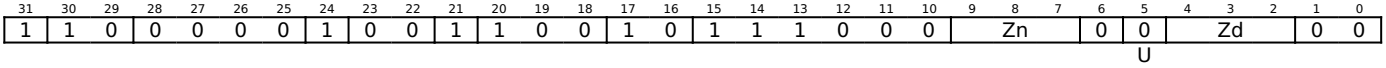
```
SCVTF { <Zd1>.S-<Zd2>.S }, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd::'0');
let nreg : integer{} = 2;
let unsigned : boolean = FALSE;
let rounding : FPRounding = FPRoundingMode(FPCR());
```

Four registers

(FEAT_SME2)



Encoding

```
SCVTF { <Zd1>.S-<Zd4>.S }, { <Zn1>.S-<Zn4>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd::'00');
let nreg : integer{} = 4;
let unsigned : boolean = FALSE;
let rounding : FPRounding = FPRoundingMode(FPCR());
```

Assembler Symbols

<Zd1>	For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn1>	For the "Two registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Zn4>	Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : bits(32) = operand[e*:32];
        results[[r]][e*:32] = FixedToFP{32, 32}(element, 0, unsigned, FPCR(), rounding);
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

SDOT (2-way, multiple and indexed vector)

Multi-vector signed 16-bit integer dot product by indexed element to 32-bit integer

This instruction calculates the dot product of two signed 16-bit integer values held in each 32-bit element of the two or four first source vectors and two signed 16-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

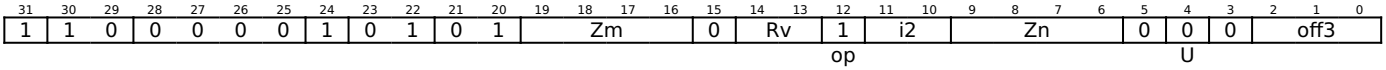
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

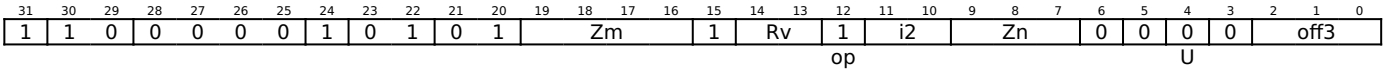
```
SDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
SDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3);
let index : integer = UInt(i2);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);

SDOT (2-way, multiple vectors)

Multi-vector signed 16-bit integer dot product to 32-bit integer

This instruction calculates the dot product of two signed 16-bit integer values held in each 32-bit element of the two or four first source vectors and two signed 16-bit integer values in the corresponding 32-bit element of the two or four second source vectors. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

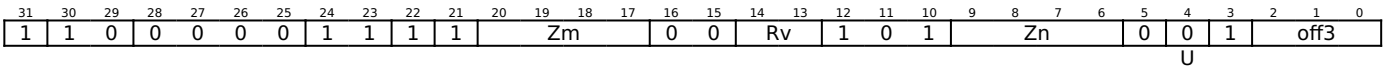
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

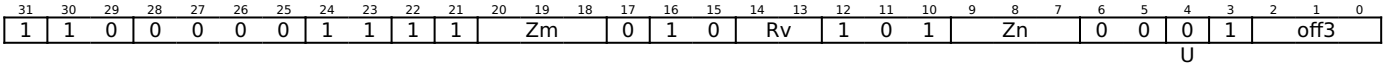
```
SDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32;
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
SDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let v : integer = UInt('010'::Rv);

SDOT (4-way, multiple and indexed vector)

Multi-vector signed integer dot product by indexed element

This instruction calculates the dot product of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the two or four first source vectors and four signed 8-bit or 16-bit integer values in the corresponding indexed 32-bit or 64-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit or 64-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 4 classes: Two ZA single-vectors of 32-bit elements , Two ZA single-vectors of 64-bit elements , Four ZA single-vectors of 32-bit elements and Four ZA single-vectors of 64-bit elements

SEL

Multi-vector conditional select

This instruction selects consecutive elements from the two or four first source vectors where vector select predicate elements are true, and places them in the corresponding elements of the two or four destination vectors. Where vector select predicate elements are false, the corresponding consecutive elements are selected from the two or four second source vectors and placed in the remaining elements of the destination vectors.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)

Encoding

```
SEL { <Zd1>.<T>-<Zd2>.<T> }, <PNv>, { <Zn1>.<T>-<Zn2>.<T> }, { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```

```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<PNv> Is the name of the vector select predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNv" plus 8.

<Zn1> For the "Two registers" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.

<Zm1>	For the "Two registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. For the "Four registers" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zd4>	Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.
<Zm4>	Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);
let pred : bits(PL) = P{PL}(v);
let mask : bits(PL*nreg) = CounterToPredicate{PL*nreg}(pred[15:0]);
for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for e = 0 to elements-1 do
        if ActivePredicateElement{PL*nreg}(mask, r * elements + e, esize) then
            results[[r]][e*:esize] = operand1[e*:esize];
        else
            results[[r]][e*:esize] = operand2[e*:esize];
        end;
    end;
end;
for r = 0 to nreg-1 do
    Z{VL}(d+r) = results[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SMAX (multiple and single vector)

Multi-vector signed maximum by vector

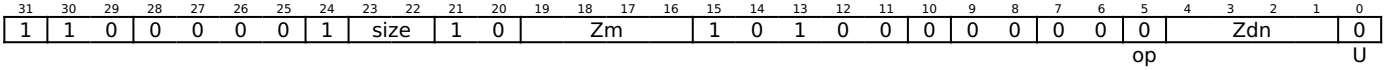
This instruction determines the signed maximum of elements of the second source vector and the corresponding elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

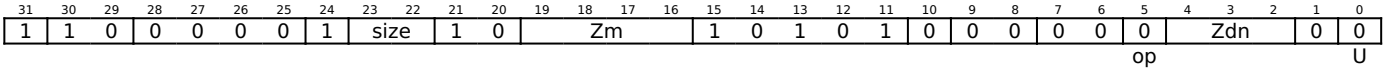
```
SMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
let unsigned : boolean = FALSE;
```

Four registers

(FEAT_SME2)



Encoding

```
SMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
let unsigned : boolean = FALSE;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let op1elt : bits(esize) = operand1[e*:esize];
        let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
        let op2elt : bits(esize) = operand2[e*:esize];
        let element2 : integer = if unsigned then UInt(op2elt) else SInt(op2elt);

SMLAL (multiple and indexed vector)

Multi-vector signed 16-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each signed 16-bit element in the one, two, or four first source vectors by each signed 16-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA double-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

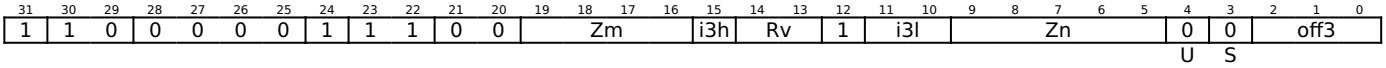
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2)



Encoding

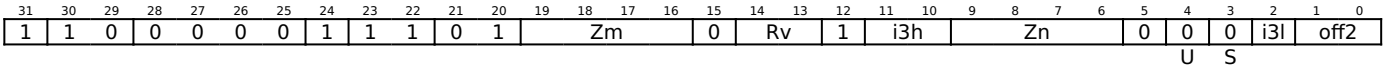
```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>], <Zn>.H, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3::'0');
let index : integer = UInt(i3h::i3l);
let nreg : integer{} = 1;
```

Two ZA double-vectors

(FEAT_SME2)



Encoding

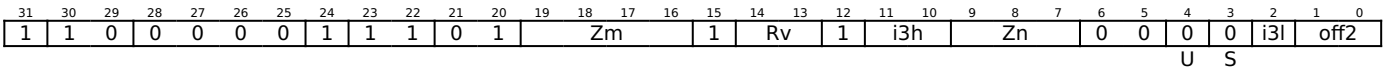
```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'0');
let index : integer = UInt(i3h::i3l);
let nreg : integer{} = 2;
```

Four ZA double-vectors

(FEAT_SME2)



Encoding

```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'0');
let index : integer = UInt(i3h::i3l);
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	For the "One ZA double-vector" variant: is the first vector select offset, encoded as "off3" field times 2. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the first vector select offset, encoded as "off2" field times 2.
<offs2>	For the "One ZA double-vector" variant: is the second vector select offset, encoded as "off3" field times 2 plus 1. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the second vector select offset, encoded as "off2" field times 2 plus 1.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
<Zn1>	For the "Two ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA double-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let eltspersegment : integer = 128 DIV esize;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);
vec = vec - vec MOD 2;

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for i = 0 to 1 do
        let operand3 : bits(VL) = ZAvector{VL}(vec+i);
        for e = 0 to elements-1 do
            let segmentbase : integer = e - e MOD eltspersegment;
            let s : integer = 2 * segmentbase + index;
            let element1 : integer = SInt(operand1[(2*e+i)*:(esize DIV 2)]);
            let element2 : integer = SInt(operand2[s*:(esize DIV 2)]);
            let product : bits(esize) = (element1 * element2)[esize-1:0];
            result[e*:esize] = operand3[e*:esize] + product;
        end;
        ZAvector{VL}(vec+i) = result;
    end;
    vec = vec + vstride;
end;
```

Operational information

SMLAL (multiple and single vector)

Multi-vector signed 16-bit integer multiply-add by vector to 32-bit integer

This instruction multiplies each signed 16-bit element in the one, two, or four first source vectors by each signed 16-bit element in the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA double-vector groups.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

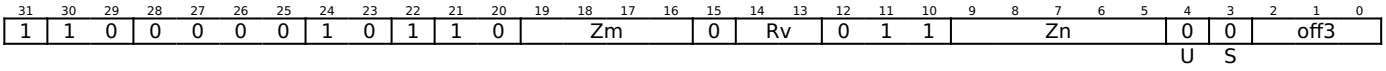
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2)



Encoding

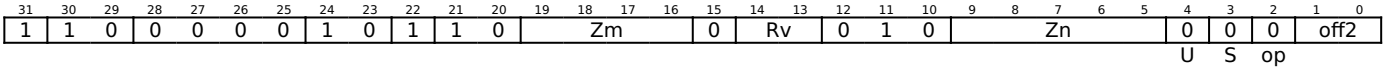
```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>], <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off3::'0');
let nreg : integer{} = 1;
```

Two ZA double-vectors

(FEAT_SME2)



Encoding

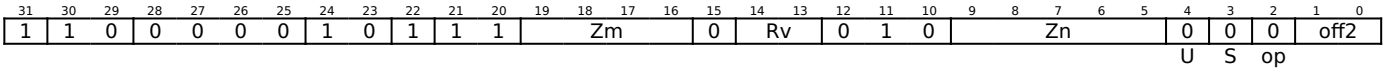
```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 2;
```

Four ZA double-vectors

(FEAT_SME2)



Encoding

```
SMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn);
let m : integer = UInt('0'::Zm);
let offset : integer = UInt(off2::'0');
let nreg : integer{} = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.
<offs1>	For the "One ZA double-vector" variant: is the first vector select offset, encoded as "off3" field times 2. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the first vector select offset, encoded as "off2" field times 2.
<offs2>	For the "One ZA double-vector" variant: is the second vector select offset, encoded as "off3" field times 2 plus 1. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the second vector select offset, encoded as "off2" field times 2 plus 1.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn".
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" plus 1 modulo 32.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" plus 3 modulo 32.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);
vec = vec - vec MOD 2;

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}((n+r) MOD 32);
    let operand2 : bits(VL) = Z{VL}(m);
    for i = 0 to 1 do
        let operand3 : bits(VL) = ZAvector{VL}(vec+i);
        for e = 0 to elements-1 do
            let element1 : integer = SInt(operand1[(2*e+i)*:(esize DIV 2)]);
            let element2 : integer = SInt(operand2[(2*e+i)*:(esize DIV 2)]);
            let product : bits(esize) = (element1 * element2)[esize-1:0];
            result[e*:esize] = operand3[e*:esize] + product;
        end;
        ZAvector{VL}(vec+i) = result;
    end;
    vec = vec + vstride;
end;
```

Operational information

SMLALL (multiple and indexed vector)

Multi-vector signed integer multiply-add long long by indexed element

This instruction multiplies each signed 8-bit or 16-bit element in the one, two, or four first source vectors by each signed 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively adds these values to the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.

<offs1> For the "One ZA quad-vector" variant: is the first vector select offset, encoded as "off2" field times 4.

For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the first vector select offset, encoded as "o1" field times 4.

<offs4> For the "One ZA quad-vector" variant: is the fourth vector select offset, encoded as "off2" field times 4 plus 3.

For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the fourth vector select offset, encoded as "o1" field times 4 plus 3.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	B
1	H

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zn1> Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn".

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" plus 1 modulo 32.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" plus 3 modulo 32.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();

SMLALL (multiple vectors)

Multi-vector signed integer multiply-add long long

This instruction multiplies each signed 8-bit or 16-bit element in the two or four first source vectors by each signed 8-bit or 16-bit element in the one, two, or four second source vectors, widens each product to 32 bits or 64 bits, and destructively adds these values to the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The quad-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

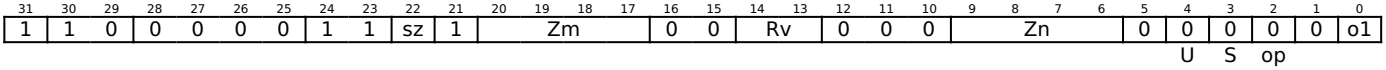
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: Two ZA quad-vectors and Four ZA quad-vectors

Two ZA quad-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))



Encoding

```
SMLALL ZA.<T>[<Wv>, <offs1>:<offs4>{, VGx2}], { <Zn1>.<Tb>-<Zn2>.<Tb> }, { <Zm1>.<Tb>-<Zm2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if sz == '1' && !IsFeatureImplemented(FEAT_SME_I16I64) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'0');
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(o1::'00');
let nreg : integer{} = 2;
```

Four ZA quad-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))

Encoding

```
SMLALL ZA.<T>[<Wv>, <offs1>:<offs4>{, VGx4}], { <Zn1>.<Tb>-<Zn4>.<Tb> }, { <Zm1>.<Tb>-<Zm4>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if sz == '1' && !IsFeatureImplemented(FEAT_SME_I16I64) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let v : integer = UInt('010'::Rv);
let n : integer = UInt(Zn::'00');
let m : integer = UInt(Zm::'00');
let offset : integer = UInt(o1::'00');
let nreg : integer{} = 4;
```

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded as "Rv" plus 8.

<offs1> Is the first vector select offset, encoded as "o1" field times 4.

<offs4> Is the fourth vector select offset, encoded as "o1" field times 4 plus 3.

<Zn1> For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.

For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	B
1	H

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.

<Zm1> For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let vectors : integer = VL DIV 8;
let vstride : integer = vectors DIV nreg;
let vbase : bits(32) = X{32}(v);
var vec : integer = (UInt(vbase) + offset) MOD vstride;
var result : bits(VL);
vec = vec - vec MOD 4;

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(n+r);
    let operand2 : bits(VL) = Z{VL}(m+r);
    for i = 0 to 3 do
        let operand3 : bits(VL) = ZAvector{VL}(vec+i);
        for e = 0 to elements-1 do
            let element1 : integer = SInt(operand1[(4*e+i)*:(esize DIV 4)]);
            let element2 : integer = SInt(operand2[(4*e+i)*:(esize DIV 4)]);
            let product : bits(esize) = (element1 * element2)[esize-1:0];
            result[e*:esize] = operand3[e*:esize] + product;
        end;
        ZAvector{VL}(vec+i) = result;
    end;
    vec = vec + vstride;
end;
```

SMLSLL (multiple and indexed vector)

Multi-vector signed integer multiply-subtract long long by indexed element

This instruction multiplies each signed 8-bit or 16-bit element in the one, two, or four first source vectors by each signed 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively subtracts these values from the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

SMLSLL (multiple and single vector)

Multi-vector signed integer multiply-subtract long long by vector

This instruction multiplies each signed 8-bit or 16-bit element in the one, two, or four first source vectors by each signed 8-bit or 16-bit element in the second source vector, widens each product to 32 bits or 64 bits, and destructively subtracts these values from the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

SMOP4A (2-way)

Signed 16-bit integer quarter-tile sum of outer products to 32-bit integer, accumulating

This instruction generates four independent quarter-tile signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.
Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products are then destructively added to the 32-bit integer destination tile.
This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

SMOP4A (4-way)

Signed integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S÷2 \times 4$ sub-matrix of 8-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_S÷2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S÷2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S÷2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D÷2 \times 4$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_D÷2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D÷2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D÷2$ sub-matrix.
The resulting quarter-tile $SVL_S÷2 \times SVL_S÷2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D÷2 \times SVL_D÷2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

SMOP4S (2-way)

Signed 16-bit integer quarter-tile sum of outer products to 32-bit integer, subtracting

This instruction generates four independent quarter-tile signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit element ZA tile.

Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products are then destructively subtracted from the 32-bit integer destination tile.

This is equivalent to performing a 2-way dot product and subtract from each of the destination tile elements.

This instruction is unpredicated.

It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

SMOP4S (4-way)

Signed integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit signed values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

SMOPA (2-way)

Signed 16-bit integer sum of outer products to 32-bit integer, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. The first source holds $SVL_S \times 2$ sub-matrix of signed 16-bit integer values, and the second source holds $2 \times SVL_S$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix, and each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

SMOPA (4-way)

Signed integer sum of outer products, accumulating

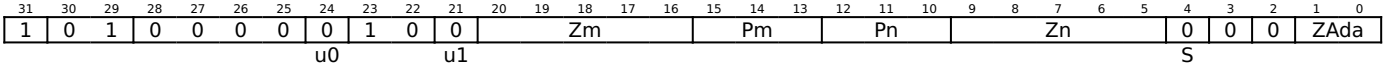
The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of signed 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of signed 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SME)



Encoding

SMOPS (4-way)

Signed integer sum of outer products, subtracting

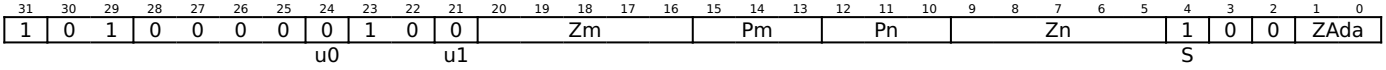
The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of signed 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of signed 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively subtracted from the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SME)



Encoding

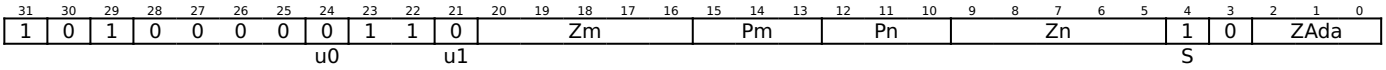
```
SMOPS <ZAda>.S, <Pn>/M, <Pm>/M, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(ZAda);
let op1_unsigned : boolean = FALSE;
let op2_unsigned : boolean = FALSE;
```

64-bit

(FEAT_SME_I16I64)



Encoding

```
SMOPS <ZAda>.D, <Pn>/M, <Pm>/M, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME_I16I64) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let a : integer = UInt(Pn);
let b : integer = UInt(Pm);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(ZAda);
let op1_unsigned : boolean = FALSE;
let op2_unsigned : boolean = FALSE;
```

Assembler Symbols

<ZAda>	For the "32-bit" variant: is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field. For the "64-bit" variant: is the name of the ZA tile ZA0-ZA7, encoded in the "ZAda" field.
<Pn>	Is the name of the first governing scalable predicate register P0-P7, encoded in the "Pn" field.

<Pm>	Is the name of the second governing scalable predicate register P0-P7, encoded in the "Pm" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer{} = VL DIV esize;
let mask1 : bits(PL) = P{PL}(a);
let mask2 : bits(PL) = P{PL}(b);
let operand1 : bits(VL) = Z{VL}(n);
let operand2 : bits(VL) = Z{VL}(m);
let operand3 : bits(dim*dim*esize) = ZAtile{dim*dim*esize}(da, esize);
var result : bits(dim*dim*esize);
var prod : integer;

for row = 0 to dim-1 do
    for col = 0 to dim-1 do
        var sum : bits(esize) = operand3[(row*dim+col)*:esize];
        for k = 0 to 3 do
            if (ActivePredicateElement{PL}(mask1, 4*row + k, esize DIV 4) &&
                  ActivePredicateElement{PL}(mask2, 4*col + k, esize DIV 4)) then
                let op1elt : bits(esize DIV 4) = operand1[(4*row + k)*:(esize DIV 4)];
                let op2elt : bits(esize DIV 4) = operand2[(4*col + k)*:(esize DIV 4)];
                let element1 : integer = if op1_unsigned then UInt(op1elt) else SInt(op1elt);
                let element2 : integer = if op2_unsigned then UInt(op2elt) else SInt(op2elt);
                prod = element1 * element2;
                sum = sum - prod;
            end;
        end;
        result[(row*dim+col)*:esize] = sum;
    end;
end;

ZAtile{dim*dim*esize}(da, esize) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SQCVT (four registers)

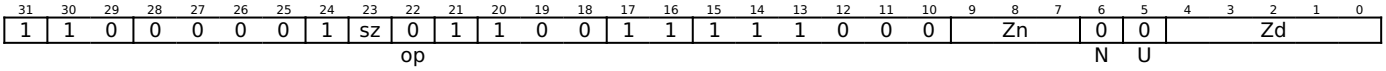
Multi-vector signed saturating extract narrow

This instruction saturates the signed integer value in each element of the four source vectors to quarter the original source element width, and places the results in the quarter-width destination elements.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQCVT <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(sz);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	B
1	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	S
1	D

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (4 * esize);
var result : bits(VL);

for r = 0 to 3 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : integer = SInt(operand[e*:(4 * esize)]);
        result[(r*elements + e)*:esize] = SignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

SQCVT (two registers)

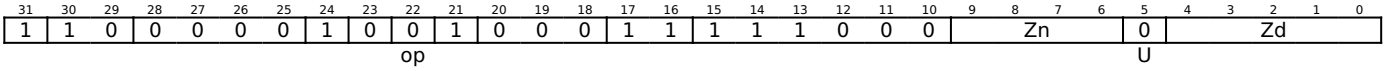
Multi-vector signed 32-bit integer saturating extract narrow to 16-bit integer

This instruction saturates the signed 32-bit integer value in each element of the two source vectors to half the original source element width, and places the 16-bit results in the half-width destination elements.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQCVT <Zd>.H, { <Zn1>.S-<Zn2>.S }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for r = 0 to 1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : integer = SInt(operand[e*:(2 * esize)]);
        result[(r*elements + e)*:esize] = SignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

SQCVTN

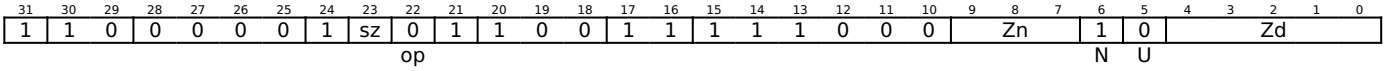
Multi-vector signed saturating extract narrow to interleaved integer

This instruction saturates the signed integer value in each element of the four source vectors to quarter the original source element width, and places the four-way interleaved results in the quarter-width destination elements.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQCVTN <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(sz);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	B
1	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	S
1	D

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (4 * esize);
var result : bits(VL);

for e = 0 to elements-1 do
    for i = 0 to 3 do
        let operand : bits(VL) = Z{VL}(n+i);
        let element : integer = SInt(operand[e*:(4 * esize)]);
        result[(4*e + i)*:esize] = SignedSat{esize}(element);
    end;
end;

Z{VL}(d) = result;
```

SQDMULH (multiple and single vector)

Multi-vector signed saturating doubling multiply high by vector

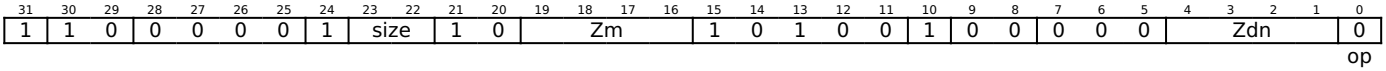
This instruction multiplies the signed elements of the two or four first source vectors by the corresponding elements of the second source vector, and then doubles the result and destructively places the most significant half of the result in the corresponding elements of the two or four first source vectors. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

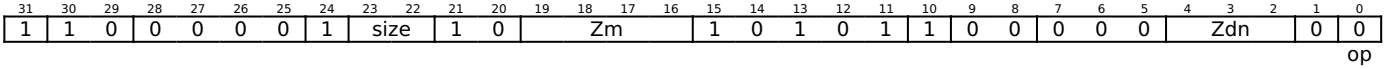
```
SQDMULH { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
SQDMULH { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var results : array [[4]] of bits(VL);

for r = 0 to nreg-1 do
    let operand1 : bits(VL) = Z{VL}(dn+r);
    let operand2 : bits(VL) = Z{VL}(m);
    for e = 0 to elements-1 do
        let element1 : integer = SInt(operand1[e*:esize]);
        let element2 : integer = SInt(operand2[e*:esize]);

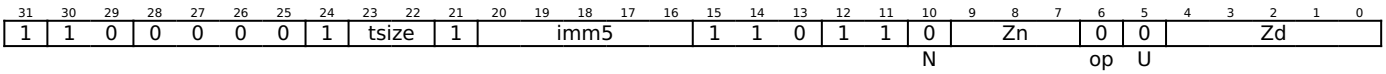
SQRSHR (four registers)

Multi-vector signed saturating rounding shift right narrow by immediate

This instruction shifts right by an immediate value the signed integer value in each element of the four source vectors, and places the rounded results in the quarter-width destination elements. Each result element is saturated to the quarter-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. The immediate shift amount is an unsigned value in the range 1 to number of bits per source element.
This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQRSHR <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if tsize == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd);
let shift : integer = 8 * esize - UInt(tsize::imm5);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsize”:

tsize	<T>
00	RESERVED
01	B
1x	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “tsize”:

tsize	<Tb>
00	RESERVED
01	S
1x	D

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

<const> Is the immediate shift amount, in the range 1 to number of bits per source element, encoded in "tsize:imm5".

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (4 * esize);
var result : bits(VL);

for r = 0 to 3 do
    let operand : bits(VL) = Z{VL}(n+r);

SQRSHR (two registers)

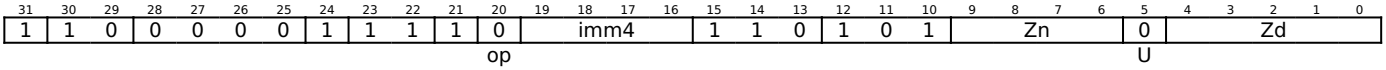
Multi-vector signed 32-bit integer saturating rounding shift right narrow by immediate to 16-bit integer

This instruction shifts right by an immediate value the signed integer value in each element of the two source vectors, and places the rounded results in the half-width destination elements. Each result element is saturated to the half-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. The immediate shift amount is an unsigned value in the range 1 to 16.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQRSHR <Zd>.H, { <Zn1>.S-<Zn2>.S }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm4);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<const>	Is the immediate shift amount, in the range 1 to 16, encoded as 16 minus "imm4".

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for r = 0 to 1 do
    let operand : bits(VL) = Z{VL}(n+r);
    for e = 0 to elements-1 do
        let element : bits(2 * esize) = operand[e*:(2 * esize)];
        let res : integer = (SInt(element) + 1 << (shift-1)) >> shift;
        result[(r*elements + e)*:esize] = SignedSat{esize}(res);
    end;
end;

Z{VL}(d) = result;
```

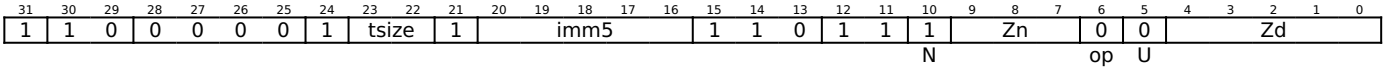
SQRSHRN

Multi-vector signed saturating rounding shift right narrow by immediate to interleaved integer

This instruction shifts right by an immediate value the signed integer value in each element of the four source vectors, and places the four-way interleaved rounded results in the quarter-width destination elements. Each result element is saturated to the quarter-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. The immediate shift amount is an unsigned value in the range 1 to number of bits per source element.
This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
SQRSHRN <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if tsize == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn::'00');
let d : integer = UInt(Zd);
let shift : integer = 8 * esize - UInt(tsize::imm5);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsize”:

tsize	<T>
00	RESERVED
01	B
1x	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

SRSHL (multiple and single vector)

Multi-vector signed rounding shift left by vector

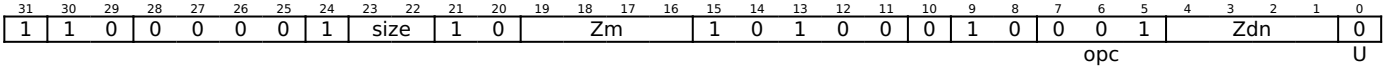
This instruction shifts the signed elements of the two or four first source vectors by the corresponding elements of the second source vector, and destructively places the rounded results in the corresponding elements of the two or four first source vectors. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

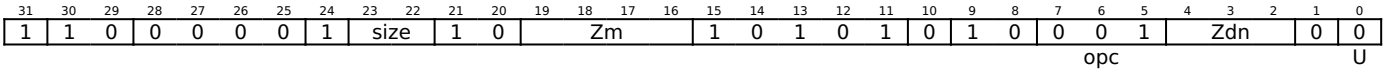
```
SRSHL { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'0');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
SRSHL { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn::'00');
let m : integer = UInt('0'::Zm);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

ST1B (scalar plus immediate, strided registers)

Contiguous store of bytes from multiple strided vectors (immediate index)

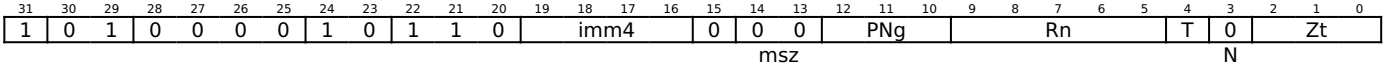
This instruction performs a contiguous store of bytes from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

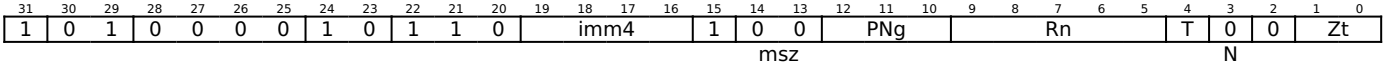
```
ST1B { <Zt1>.B, <Zt2>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```
ST1B { <Zt1>.B, <Zt2>.B, <Zt3>.B, <Zt4>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".
<Zt2>	For the "Two registers" variant: is the name of the second scalable vector register Z8-Z15 or Z24-Z31 to be transferred, encoded as "T:'1':Zt". For the "Four registers" variant: is the name of the second scalable vector register Z4-Z7 or Z20-Z23 to be transferred, encoded as "T:'01':Zt".
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt3>	Is the name of the third scalable vector register Z8-Z11 or Z24-Z27 to be transferred, encoded as "T:'10':Zt".
<Zt4>	Is the name of the fourth scalable vector register Z12-Z15 or Z28-Z31 to be transferred, encoded as "T:'11':Zt".

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();

ST1B (scalar plus scalar, strided registers)

Contiguous store of bytes from multiple strided vectors (scalar index)

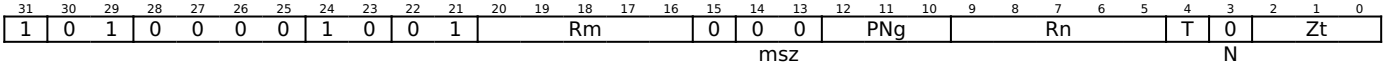
This instruction performs a contiguous store of bytes from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

```
ST1B { <Zt1>.B, <Zt2>.B }, <PNg>, [<Xn|SP>, <Xm>]

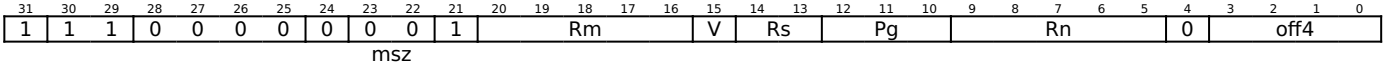
ST1B (scalar plus scalar, tile slice)

Contiguous store of bytes from 8-bit element ZA tile slice

This instruction performs a contiguous store of bytes from an 8-bit element ZA tile slice. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of 8-bit elements in a vector. The immediate offset is in the range 0 to 15. The memory address is generated by a 64-bit scalar base and an optional 64-bit scalar offset that is added to the base address. Inactive elements are not written to memory.

SME

(FEAT_SME)



Encoding

```
ST1B { ZA0<HV>.B[<Ws>, <offs>] }, <Pg>, [<Xn|SP>{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('0'::Pg);
let s : integer = UInt('011'::Rs);
let t : integer = 0;
let offset : integer = UInt(off4);
let esize : integer{} = 8;
let vertical : boolean = V == '1';
```

Assembler Symbols

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> Is the slice index offset, in the range 0 to 15, encoded in the "off4" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();

ST1H (scalar plus scalar, strided registers)

Contiguous store of halfwords from multiple strided vectors (scalar index)

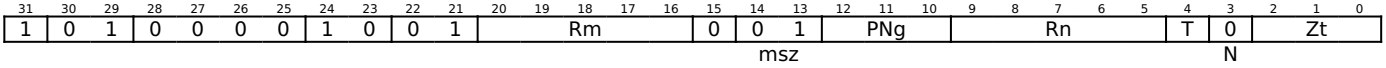
This instruction performs a contiguous store of halfwords from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

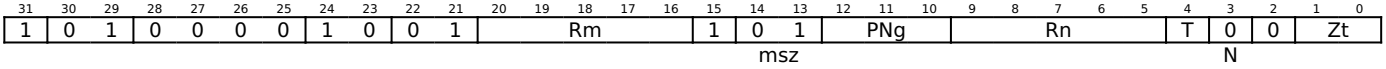
```
ST1H { <Zt1>.H, <Zt2>.H }, <PNg>, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 16;
```

Four registers

(FEAT_SME2)



Encoding

```
ST1H { <Zt1>.H, <Zt2>.H, <Zt3>.H, <Zt4>.H }, <PNg>, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 16;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".
<Zt2>	For the "Two registers" variant: is the name of the second scalable vector register Z8-Z15 or Z24-Z31 to be transferred, encoded as "T:'1':Zt". For the "Four registers" variant: is the name of the second scalable vector register Z4-Z7 or Z20-Z23 to be transferred, encoded as "T:'01':Zt".
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt3>	Is the name of the third scalable vector register Z8-Z11 or Z24-Z27 to be transferred, encoded as "T:'10':Zt".
<Zt4>	Is the name of the fourth scalable vector register Z12-Z15 or Z28-Z31 to be transferred, encoded as "T:'11':Zt".

Operation

```
CheckStreamingSVEEnabled();
let VL : integer{} = CurrentVL();

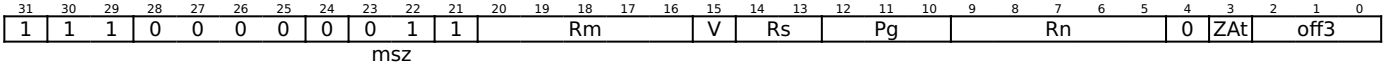
ST1H (scalar plus scalar, tile slice)

Contiguous store of halfwords from 16-bit element ZA tile slice

This instruction performs a contiguous store of halfwords from a 16-bit element ZA tile slice. The slice number within the tile is selected by the sum of the slice index register and immediate offset, modulo the number of 16-bit elements in a vector. The immediate offset is in the range 0 to 7. The memory address is generated by a 64-bit scalar base and an optional 64-bit scalar offset that is multiplied by 2 and added to the base address. Inactive elements are not written to memory.

SME

(FEAT_SME)



Encoding

```
ST1H { <ZAt><HV>.H[<Ws>, <offs>] }, <Pg>, [<Xn|SP>{, <Xm>, LSL #1}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('0'::Pg);
let s : integer = UInt('011'::Rs);
let t : integer = UInt(ZAt);
let offset : integer = UInt(off3);
let esize : integer{} = 16;
let vertical : boolean = V == '1';
```

Assembler Symbols

<ZAt> Is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAt" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded as "Rs" plus 12.

<offs> Is the slice index offset, in the range 0 to 7, encoded in the "off3" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let dim : integer = VL DIV esize;
var base : bits(64);
var addr : bits(64);

ST1W (scalar plus immediate, strided registers)

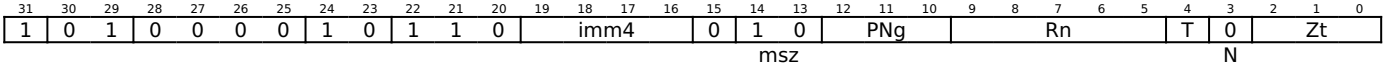
Contiguous store of words from multiple strided vectors (immediate index)

This instruction performs a contiguous store of words from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

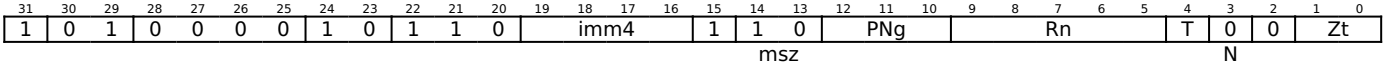
```
ST1W { <Zt1>.S, <Zt2>.S }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```
ST1W { <Zt1>.S, <Zt2>.S, <Zt3>.S, <Zt4>.S }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".

STMOPA (2-way)

Signed 16-bit integer sparse sum of outer products to 32-bit integer, accumulating

This instruction generates signed integer sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected 2-in-4 16-bit signed values from each overlapping 32-bit containers of the two $SVL_S \times 2$ sub-matrices in the first source vectors by the two 16-bit signed values from the corresponding 32-bit container of the $2 \times SVL_S$ sub-matrix in the second source vector. The two selected elements from each overlapping 32-bit containers of the first source vectors correspond to 2-in-4 elements of rows of two $SVL_S \times 2$ sub-matrices. Each 32-bit container of the second source vector holds 2 elements of columns of a compressed $2 \times SVL_S$ sub-matrix.

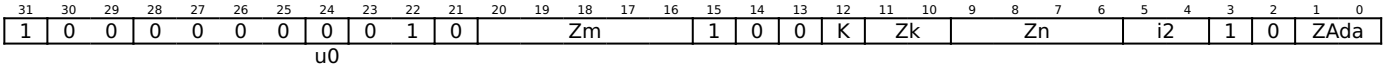
The 2-in-4 16-bit signed values from overlapping 32-bit containers of the first source vectors are selected by 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to 32-bit containers of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.

This instruction is unpredicated.

SME2

(FEAT_SME_TMOP)



Encoding

```
STMOPA <ZAda>.S, { <Zn1>.H-<Zn2>.H }, <Zm>.H, <Zk>[<index>]
```

Decode for this encoding

```

STMOPA (4-way)

Signed 8-bit integer sparse sum of outer products to 32-bit integer, accumulating

This instruction generates signed integer sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected two sets of 2-in-4 8-bit signed values from each overlapping 32-bit containers of the two $SVL_S \times 4$ sub-matrices in the first source vectors by the four 8-bit signed values from the corresponding 32-bit container of the $4 \times SVL_S$ sub-matrix in the second source vector. The four selected elements from the overlapping 32-bit containers of the first source vectors correspond to two sets of 2-in-4 elements of rows of two $SVL_S \times 4$ sub-matrices. Each 32-bit container of the second source vector holds 4 elements of columns of a compressed $4 \times SVL_S$ sub-matrix.

The two sets of 2-in-4 8-bit signed values from overlapping 32-bit containers of the first source vectors are selected by pairs of 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to each 32-bit container of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

This instruction is unpredicated.

STNT1B (scalar plus immediate, strided registers)

Contiguous store non-temporal of bytes from multiple strided vectors (immediate index)

This instruction performs a contiguous non-temporal store of bytes from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

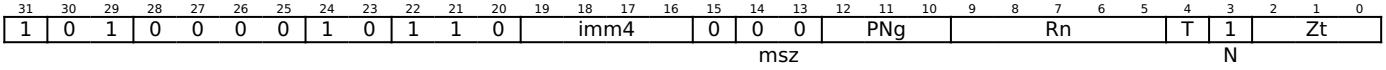
Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

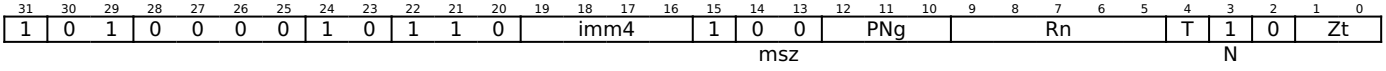
```
STNT1B { <Zt1>.B, <Zt2>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2)



Encoding

```

STNT1D (scalar plus scalar, strided registers)

Contiguous store non-temporal of doublewords from multiple strided vectors (scalar index)

This instruction performs a contiguous non-temporal store of doublewords from elements of two or four strided vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

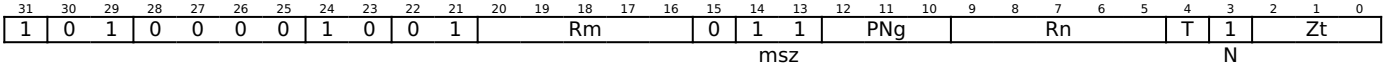
Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

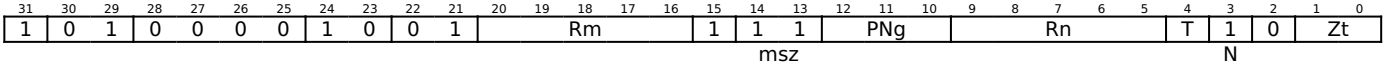
```
STNT1D { <Zt1>.D, <Zt2>.D }, <PNg>, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let tstride : integer = 8;
let t : integer = UInt(T::'0'::Zt);
let esize : integer{} = 64;
```

Four registers

(FEAT_SME2)



Encoding

```
STNT1D { <Zt1>.D, <Zt2>.D, <Zt3>.D, <Zt4>.D }, <PNg>, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let tstride : integer = 4;
let t : integer = UInt(T::'00'::Zt);
let esize : integer{} = 64;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register Z0-Z7 or Z16-Z23 to be transferred, encoded as "T:'0':Zt". For the "Four registers" variant: is the name of the first scalable vector register Z0-Z3 or Z16-Z19 to be transferred, encoded as "T:'00':Zt".

STR (array vector)

Store ZA array vector

This instruction performs a contiguous store of bytes from a ZA array vector to the memory address generated by a 64-bit scalar base plus an optional immediate offset multiplied by the current vector length in bytes. The ZA array vector is selected by the sum of the vector select register and the same immediate offset, modulo the number of bytes in a Streaming SVE vector.

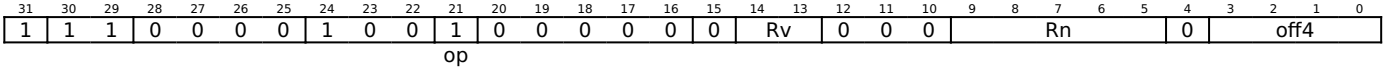
This instruction is unpredicated.

The store is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME

(FEAT_SME)



Encoding

```
STR ZA[<Wv>, <offs>], [<Xn|SP>{, #<offs>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let v : integer = UInt('011'::Rv);
let offset : integer = UInt(off4);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W12-W15, encoded as "Rv" plus 12.
<offs>	Is the vector select offset and optional memory offset, in the range 0 to 15, defaulting to 0, encoded in the "off4" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEAndZAEnabled();
let SVL : integer{} = CurrentSVL();
let dim : integer{} = SVL DIV 8;
var base : bits(64);
let moffs : integer = offset * dim;
var src : bits(SVL);
let vbase : bits(32) = X{32}(v);
let vec : integer = (UInt(vbase) + offset) MOD dim;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSME(MemOp_STORE, nontemporal, contiguous,
                                                  tagchecked);
if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;
src = ZAvector{SVL}(vec);
var addr : bits(64) = AddressAdd(base, moffs, accdesc);
let aligned : boolean = IsAlignedSize(base, 16);
if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;
for e = 0 to dim-1 do
    AArch64_MemSingle{8}(addr, accdesc, aligned) = src[e*:8];
    addr = AddressIncrement(addr, 1, accdesc);
end;
```

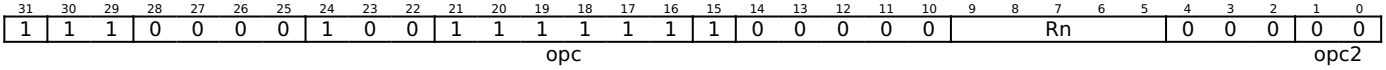
STR (table)

Store ZT0 register

This instruction stores the 64-byte ZT0 register to the memory address provided in the 64-bit scalar base register. This instruction is unpredicated.
The store is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.
This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME2

(FEAT_SME2)



Encoding

```
STR ZT0, [<Xn|SP>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Rn);
let esize : integer{} = 8;
```

Assembler Symbols

<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();
let tablesize : integer{} = 512;
let elements : integer = tablesize DIV esize;
var addr : bits(64);
let table : bits(tablesize) = ZT0{tablesize}();
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSME(MemOp_STORE, nontemporal, contiguous,
                                                  tagchecked);
if n == 31 then
    CheckSPAlignment();
    addr = SP{64}();
else
    addr = X{64}(n);
end;
let aligned : boolean = IsAlignedSize(addr, 16);
if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;
for e = 0 to elements-1 do
    AArch64_MemSingle{esize}(addr, accdesc, aligned) = table[e*:esize];
    addr = AddressIncrement(addr, esize DIV 8, accdesc);
end;
```

SUB (to array, array and multiple vectors)

Multi-vector subtract from ZA array vectors

This instruction destructively subtracts all elements of the two or four source vectors from the corresponding elements of the ZA single-vector groups.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

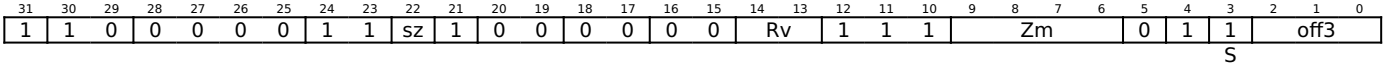
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 64-bit integer variant is implemented.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))



Encoding

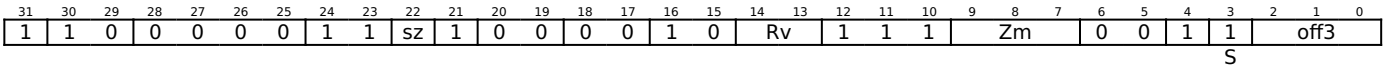
```
SUB ZA.<T>[<Wv>, <offs>{, VGx2}], { <Zm1>.<T>-<Zm2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF); end;
if sz == '1' && !IsFeatureImplemented(FEAT_SME_I16I64) then
    EndOfDecode(Decode_UNDEF);
end;
let v : integer = UInt('010'::Rv);
let esize : integer{} = 32 << UInt(sz);
let m : integer = UInt(Zm::'0');
let offset : integer = UInt(off3);
let nreg : integer{} = 2;
```

Four ZA single-vectors

(FEAT_SME2 && (sz == '0' || FEAT_SME_I16I64))



Encoding

```
SUB ZA.<T>[<Wv>, <offs>{, VGx4}], { <Zm1>.<T>-<Zm4>.<T> }
```

Decode for this encoding

SUDOT (4-way, multiple and indexed vector)

Multi-vector signed by unsigned 8-bit integer dot product by indexed elements to 32-bit integer

This instruction calculates the dot product of four signed 8-bit integer values held in each 32-bit element of the two or four first source vectors and four unsigned 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors
