FACLE

Floating-point absolute compare less than or equal

This instruction compares Active absolute values of floating-point elements in the first source vector being less than or equal to the corresponding absolute values of elements in the second source vector, and places the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

This is a pseudo-instruction of FAC<cc>. This means:

- The encodings in this description are named to match the encodings of FAC<cc>.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FAC<cc> gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Greater than or equal

    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FADDA

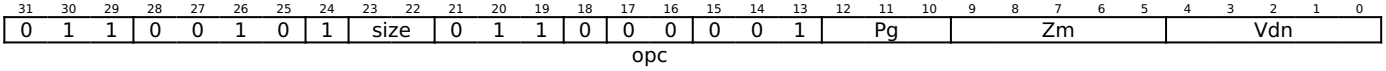
Floating-point add strictly-ordered reduction, accumulating in scalar

This instruction adds the floating-point values in a SIMD&FP scalar source and all active lanes of the vector source and destructively places the result in the SIMD&FP scalar source register. Vector elements are processed strictly in order from low to high, with the scalar source providing the initial value. Inactive elements in the source vector are ignored.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
FADDA <V><dn>, <Pg>, <V><dn>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;

FAMAX

Floating-point absolute maximum (predicated)

This instruction determines the maximum absolute value from Active floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector.
The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

Inactive elements in the destination vector register remain unmodified.

```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPAbsMax{esize}(element1, element2, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FAMIN

Floating-point absolute minimum (predicated)

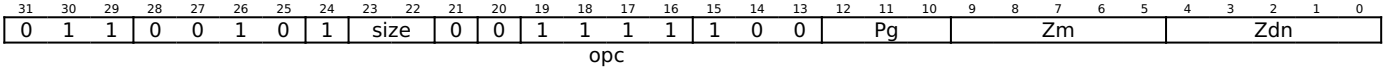
This instruction determines the minimum absolute value from Active floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector.
The behavior is as follows:

- Alternate floating-point behaviors do not apply, as if FPCR.AH is 0.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN derived as follows:
  - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
  - Otherwise, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a NaN, the result is the default NaN, with the sign bit set to 0.
- Denormalized inputs and results are never flushed to zero, as if FPCR.{FZ, FZ16, FIZ} are all 0.
- Denormalized inputs never generate an Input Denormal floating-point exception.

Inactive elements in the destination vector register remain unmodified.

SVE2

((FEAT_SVE2 || FEAT_SME2) && FEAT_FAMINMAX)



Encoding

```
FAMIN <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||

FCADD

Floating-point complex add (predicated)

This instruction adds the real and imaginary components of the Active floating-point complex numbers from the first source vector to the complex numbers from the second source vector that have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. The results are destructively placed in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
FCADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let sub_i : boolean = (rot == '0');
let sub_r : boolean = (rot == '1');
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<const> Is the const specifier, encoded in “rot”:

rot	<const>
0	#90
1	#270

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let pairs : integer = VL DIV (2 * esize);
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for p = 0 to pairs-1 do
    var acc_r : bits(esize) = operand1[(2 * p + 0)*:esize];
    var acc_i : bits(esize) = operand1[(2 * p + 1)*:esize];
    if ActivePredicateElement{PL}(mask, 2 * p + 0, esize) then
        var elt2_i : bits(esize) = operand2[(2 * p + 1)*:esize];
        if sub_i then elt2_i = FPNeg{esize}(elt2_i, FPCR()); end;
        acc_r = FPAdd{esize}(acc_r, elt2_i, FPCR());
    end;
    if ActivePredicateElement{PL}(mask, 2 * p + 1, esize) then
        var elt2_r : bits(esize) = operand2[(2 * p + 0)*:esize];
        if sub_r then elt2_r = FPNeg{esize}(elt2_r, FPCR()); end;
        acc_i = FPAdd{esize}(acc_i, elt2_r, FPCR());
    end;
    result[(2 * p + 0)*:esize] = acc_r;
    result[(2 * p + 1)*:esize] = acc_i;
end;

Z{VL}(dn) = result;
```

FCLAMP

Floating-point clamp to minimum/maximum number

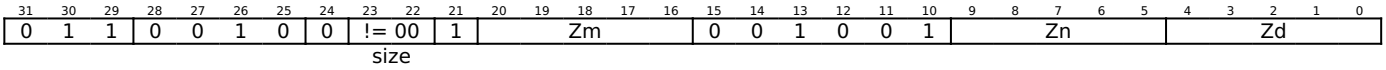
This instruction clamps each floating-point element in the destination vector to between the floating-point minimum value in the corresponding element of the first source vector and the floating-point maximum value in the corresponding element of the second source vector and destructively places the clamped results in the corresponding elements of the destination vector.
The behavior is as follows for each minimum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

This instruction is unpredicated.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
FCLAMP <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var result : bits(VL);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(d);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    let element3 : bits(esize) = operand3[e*:esize];
    let maxelement : bits(esize) = FPMaxNum{}(element1, element3, FPCR());
    result[e*:esize] = FPMinNum{esize}(maxelement, element2, FPCR());
end;
Z{VL}(d) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.

    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

P{PL}(d) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the predicate register written by this instruction might be significantly delayed.

FCMLA (indexed)

Floating-point complex multiply-add by indexed element

This instruction multiplies the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180, or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

This instruction then destructively adds the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

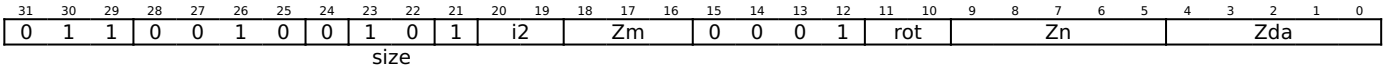
Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index that selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment. This instruction is unpredicated.

It has encodings from 2 classes: Half-precision and Single-precision

Half-precision

(FEAT_SVE || FEAT_SME)



Encoding

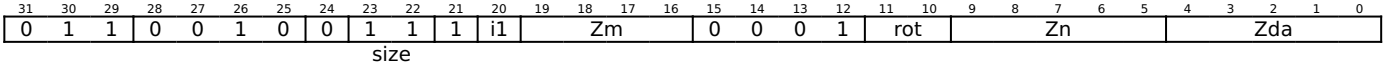
```
FCMLA <Zda>.H, <Zn>.H, <Zm>.H[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel_a : integer = UInt(rot[0]);
let sel_b : integer = UInt(NOT rot[0]);
let neg_i : boolean = (rot[1] == '1');
let neg_r : boolean = (rot[0] != rot[1]);
```

Single-precision

(FEAT_SVE || FEAT_SME)



Encoding

```
FCMLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel_a : integer = UInt(rot[0]);
let sel_b : integer = UInt(NOT rot[0]);
let neg_i : boolean = (rot[1] == '1');
let neg_r : boolean = (rot[0] != rot[1]);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> For the "Half-precision" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.

For the "Single-precision" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<imm> For the "Half-precision" variant: is the index of a Real and Imaginary pair, in the range 0 to 3, encoded in the "i2" field.

For the "Single-precision" variant: is the index of a Real and Imaginary pair, in the range 0 to 1, encoded in the "i1" field.

<const> Is the const specifier, encoded in “rot”:

rot	<const>
00	#0
01	#90
10	#180
11	#270

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV (2 * esize);
let pairspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);

```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FCMLE (vectors)

Floating-point compare less than or equal to vector

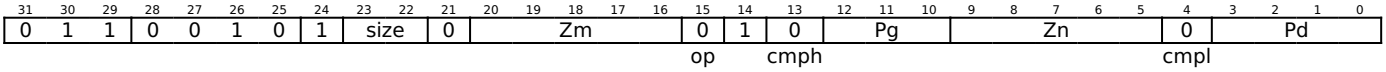
This instruction compares Active floating-point elements in the first source vector being less than or equal to the corresponding elements in the second source vector, and places the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

This is a pseudo-instruction of FCM<cc> (vectors). This means:

- The encodings in this description are named to match the encodings of FCM<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FCM<cc> (vectors) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Greater than or equal

(FEAT_SVE || FEAT_SME)



Encoding

```
FCMLE <Pd>.<T>, <Pg>/Z, <Zm>.<T>, <Zn>.<T>
```

is equivalent to

```
FCMGE <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

FCVT

Floating-point convert (predicated)

This instruction converts the size and precision of each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 12 classes: Half-precision to single-precision, merging , Half-precision to single-precision, zeroing , Half-precision to double-precision, merging , Half-precision to double-precision, zeroing , Single-precision to half-precision, merging , Single-precision to half-precision, zeroing , Single-precision to double-precision, merging , Single-precision to double-precision, zeroing , Double-precision to half-precision, merging , Double-precision to half-precision, zeroing , Double-precision to single-precision, merging and Double-precision to single-precision, zeroing

FCVTX

Double-precision convert to single-precision, rounding to odd (predicated)

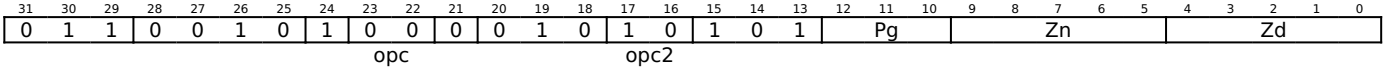
This instruction converts Active double-precision elements from the source vector to single-precision, rounding to Odd, and places the results in the even-numbered 32-bit elements of the destination vector, while setting the odd-numbered elements to zero. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

Rounding to Odd (aka Von Neumann rounding) permits a two-step conversion from double-precision to half-precision without incurring intermediate rounding errors.

It has encodings from 2 classes: Double-precision to single-precision, merging and Double-precision to single-precision, zeroing

Double-precision to single-precision, merging

(FEAT_SVE2 || FEAT_SME)



Encoding

```
FCVTX <Zd>.S, <Pg>/M, <Zn>.D
```

Decode for this encoding

FCVTZS

Floating-point convert to signed integer, rounding toward zero (predicated)

This instruction converts to the signed integer nearer to zero from each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are sign-extended to fill each destination element.

It has encodings from 14 classes: Half-precision to 16-bit, merging , Half-precision to 16-bit, zeroing , Half-precision to 32-bit, merging , Half-precision to 32-bit, zeroing , Half-precision to 64-bit, merging , Half-precision to 64-bit, zeroing , Single-precision to 32-bit, merging , Single-precision to 32-bit, zeroing , Single-precision to 64-bit, merging , Single-precision to 64-bit, zeroing , Double-precision to 32-bit, merging , Double-precision to 32-bit, zeroing , Double-precision to 64-bit, merging and Double-precision to 64-bit, zeroing

Half-precision to 16-bit, merging

(FEAT_SVE || FEAT_SME)

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        let res : bits(d_esize) = FPToFixed{d_esize, s_esize}(element[s_esize-1:0], 0, unsigned,
                                                              FPCR(), rounding);
        result[e*:esize] = Extend{esize}(res, unsigned);
    end;
end;

Z{VL}(d) = result;
```

Operational information

For the "Half-precision to 16-bit, merging" , "Half-precision to 32-bit, merging" , "Half-precision to 64-bit, merging" , "Single-precision to 32-bit, merging" , "Single-precision to 64-bit, merging" , "Double-precision to 32-bit, merging" , "Double-precision to 64-bit, merging" variants:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

FCVTZSN

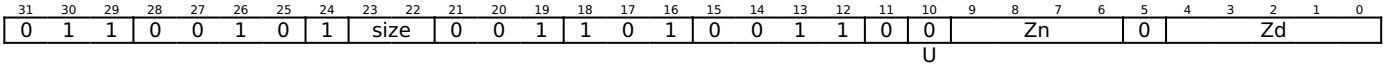
Floating-point narrowing convert to interleaved signed integer, rounding toward zero

This instruction converts each floating-point element of the pair of source vectors to half-width signed integer nearer to zero, and places the two-way interleaved results in the corresponding half-width elements of the destination vector.

This instruction is unpredicated.

SVE2

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

```
FCVTZSN <Zd>.<T>, { <Zn1>.<Tb>-<Zn2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let unsigned : boolean = FALSE;
let rounding : FPRounding = FPRounding_ZERO;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n+0);
let operand2 : bits(VL) = Z{}(n+1);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[(2*e + 0)*:(esize DIV 2)] = FPToFixed{esize DIV 2, esize}(element1, 0, unsigned, FPCR(),
                                                                     rounding);
    result[(2*e + 1)*:(esize DIV 2)] = FPToFixed{esize DIV 2, esize}(element2, 0, unsigned, FPCR(),
                                                                     rounding);
end;

Z{VL}(d) = result;
```

FCVTZU

Floating-point convert to unsigned integer, rounding toward zero (predicated)

This instruction converts to the unsigned integer nearer to zero from each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 14 classes: Half-precision to 16-bit, merging , Half-precision to 16-bit, zeroing , Half-precision to 32-bit, merging , Half-precision to 32-bit, zeroing , Half-precision to 64-bit, merging , Half-precision to 64-bit, zeroing , Single-precision to 32-bit, merging , Single-precision to 32-bit, zeroing , Single-precision to 64-bit, merging , Single-precision to 64-bit, zeroing , Double-precision to 32-bit, merging , Double-precision to 32-bit, zeroing , Double-precision to 64-bit, merging and Double-precision to 64-bit, zeroing

FCVTZUN

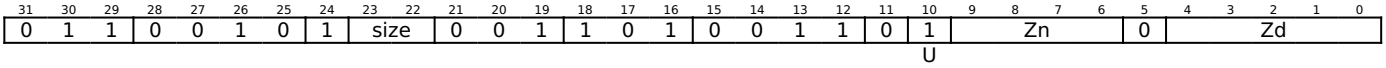
Floating-point narrowing convert to interleaved unsigned integer, rounding toward zero

This instruction converts each floating-point element of the pair of source vectors to half-width unsigned integer nearer to zero, and places the two-way interleaved results in the corresponding half-width elements of the destination vector.

This instruction is unpredicated.

SVE2

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

```
FCVTZUN <Zd>.<T>, { <Zn1>.<Tb>-<Zn2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let unsigned : boolean = TRUE;
let rounding : FPRounding = FPRounding_ZERO;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n+0);
let operand2 : bits(VL) = Z{}(n+1);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[(2*e + 0)*:(esize DIV 2)] = FPToFixed{esize DIV 2, esize}(element1, 0, unsigned, FPCR(),
                                                                     rounding);
    result[(2*e + 1)*:(esize DIV 2)] = FPToFixed{esize DIV 2, esize}(element2, 0, unsigned, FPCR(),
                                                                     rounding);
end;

FDOT (2-way, indexed, FP16 to FP32)

Half-precision dot product by indexed element to single-precision

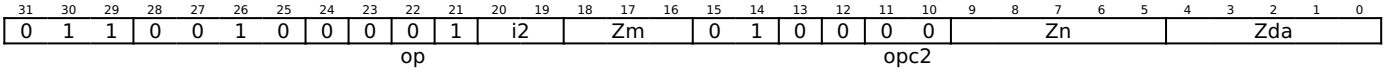
This instruction calculates the fused sum-of-products of a pair of half-precision values held in each 32-bit element of the first source vector and a pair of half-precision values in an indexed 32-bit element of the second source vector, without intermediate rounding, and then destructively adds the single-precision sum-of-products to the corresponding single-precision element of the destination vector.

The half-precision pairs within the second source vector are specified using an immediate index that selects the same pair position within each 128-bit vector segment. The index range is from 0 to 3.

This instruction is unpredicated.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
FDOT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let index : integer = UInt(i2);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
let eltspersegment : integer = 128 DIV 32;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let elt1_a : bits(16) = operand1[(2 * e + 0)*:16];
    let elt1_b : bits(16) = operand1[(2 * e + 1)*:16];
    let elt2_a : bits(16) = operand2[(2 * s + 0)*:16];
    let elt2_b : bits(16) = operand2[(2 * s + 1)*:16];
    var sum : bits(32) = operand3[e*:32];

    sum = FPDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR());
    result[e*:32] = sum;
end;

Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

FDOT (2-way, indexed, FP8 to FP16)

8-bit floating-point dot product by indexed element to half-precision

This instruction calculates the fused sum-of-products of a pair of 8-bit floating-point values held in each 16-bit element of the first source vector and a pair of 8-bit floating-point values in an indexed 16-bit element of the second source vector. The half-precision sum-of-products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$, before being destructively added without intermediate rounding to the corresponding half-precision elements of the destination vector.

The 8-bit floating-point groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

FDOT (4-way, vectors)

8-bit floating-point dot product to single-precision

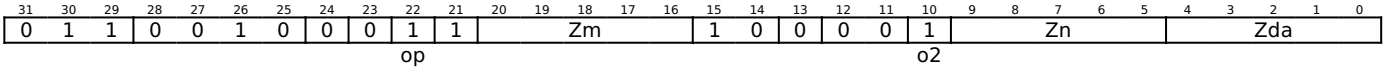
This instruction calculates the fused sum-of-products of a group of four 8-bit floating-point values held in each 32-bit element of the first source and second source vectors. The single-precision sum-of-products are scaled by $2^{-\text{UInt(FPMR.LSCALE)}}$, before being destructively added without intermediate rounding to the corresponding single-precision elements of the destination vector.

The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

SVE2

((FEAT_SVE2 && FEAT_FP8DOT4) || FEAT_SSVE_FP8DOT4)



Encoding

```
FDOT <Zda>.S, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !HaveSVE2FP8DOT4() then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckFPMREnabled();
if IsFeatureImplemented(FEAT_SSVE_FP8DOT4) && IsFeatureImplemented(FEAT_FP8DOT4) then
    CheckSVEEnabled();
elsif IsFeatureImplemented(FEAT_FP8DOT4) then
    CheckNonStreamingSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 32;
let operand1 : bits(VL) = Z{}(n);

FDUP

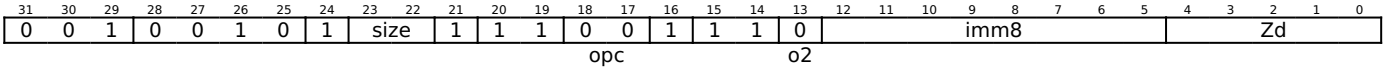
Broadcast floating-point immediate to vector elements (unpredicated)

This instruction unconditionally broadcasts the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias FMOV (immediate, unpredicated).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FDUP <Zd>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Zd);
let imm : bits(esize) = VFPExpandImm{}(imm8);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<const> Is a floating-point immediate value expressible as ±n÷16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var result : bits(VL);

for e = 0 to elements-1 do
    result[e*:esize] = imm;
end;

Z{VL}(d) = result;
```

FEXPA

Floating-point exponential accelerator

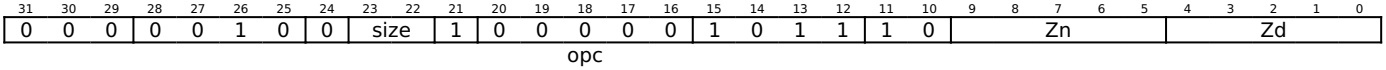
This instruction calculates an exponentiation acceleration operation on each floating-point element in the source vector, where the result sign is zero, the result exponent field is copied from a set of significant bits of the input fraction, and the result fraction is inserted from a lookup table indexed by the least-significant input fraction bits, and returns each result in the corresponding element of the destination vector.
This instruction is fully defined by its bit-manipulation semantics, does not generate floating-point exceptions, and does not guarantee NaN propagation.
For double-precision variants, the result element exponent is copied from the source element bits<16:6>, and the result fraction is set based on the source element to the rounded value of $2^{52} \times (2^{bits<5:0>/64} - 1)$.
For single-precision variants, the result element exponent is copied from the source element bits<13:6>, and the result fraction is set based on the source element to the rounded value of $2^{23} \times (2^{bits<5:0>/64} - 1)$.
For half-precision variants, the result element exponent is copied from the source element bits<9:5>, and the result fraction is set based on the source element to the rounded value of $2^{10} \times (2^{bits<4:0>/32} - 1)$.
This instruction is unpredicated.
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled, or FEAT_SSVE_FEXPA is implemented.

Note

For a double-precision input value x in the range 70,368,744,177,655 <= x < 70,368,744,179,711, the operation performed by this instruction is equivalent to calculating $2^{x-70,368,744,178,687}$.
For a single-precision input value x in the range 131,073 <= x < 131,327, the operation performed by this instruction is equivalent to calculating $2^{x-131,199}$.
For a half-precision input value x in the range 33 <= x < 63, the operation performed by this instruction is equivalent to calculating 2^{x-47}.

SVE

(FEAT_SVE || FEAT_SSVE_FEXPA)



Encoding

```
FEXPA <Zd>.<T>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SSVE_FEXPA) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_FEXPA) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();

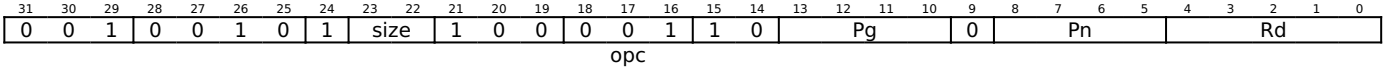
FIRSTP

Scalar index of first true predicate element (predicated)

This instruction determines the index of the First active and true element of the source predicate, and places the scalar result in the destination general-purpose register. If there are no Active and true elements, the destination general-purpose register is updated to the value minus one.

SVE2

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FIRSTP <Xd>, <Pg>, <Pn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let d : integer = UInt(Rd);
```

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(PL) = P{}(n);
var index : integer = -1;

for e = 0 to elements-1 do
    if (index == -1 && ActivePredicateElement{PL}(mask, e, esize) &&
          ActivePredicateElement{PL}(operand, e, esize)) then
        index = e;
    end;
end;

X{64}(d) = index[63:0];
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

FLOGB

Floating-point base 2 logarithm as integer

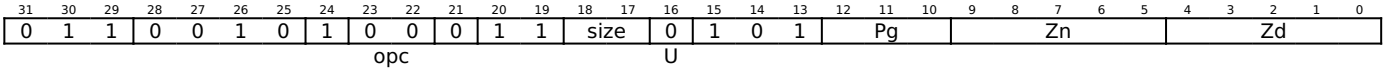
This instruction returns the signed integer base 2 logarithm of each floating-point input element |x| after normalization.
This is the unbiased exponent of x used in the representation of the floating-point value, such that, for positive x, x = significand × $2^{exponent}$.
The integer results are placed in elements of the destination vector that have the same width (esize) as the floating-point input elements:

- If x is normal, the result is the base 2 logarithm of x.
- If x is subnormal, the result corresponds to the normalized representation.
- If x is infinite, the result is $2^{(esize-1)}$-1.
- If x is ±0.0 or NaN, the result is $-2^{(esize-1)}$.

Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.
It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2 || FEAT_SME)



Encoding

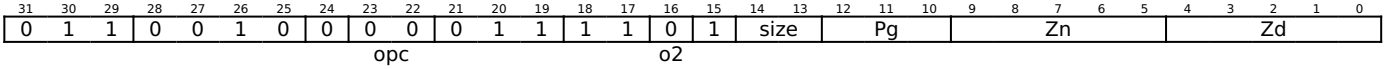
```
FLOGB <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FLOGB <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPLogB{esize}(element, FPCR());
    end;
end;

Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

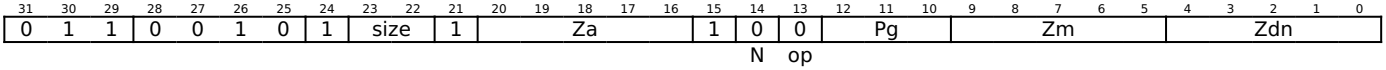
FMAD

Floating-point fused multiply-add to multiplicand (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and adds the result to elements of the third (addend) vector without intermediate rounding. The results are destructively placed in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMAD <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let a : integer = UInt(Za);
let op1_neg : boolean = FALSE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Za> Is the name of the third source scalable vector register, encoded in the "Za" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let op1 : bits(VL) = Z{}(dn);
let op2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let op3 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(a) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                                   else op1[e*:esize]);
        let elem2 : bits(esize) = op2[e*:esize];
        let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(op3[e*:esize], FPCR())
                                   else op3[e*:esize]);

        result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());
    else
        result[e*:esize] = op1[e*:esize];

    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

FMAX (immediate)

Floating-point maximum with immediate (predicated)

This instruction determines the maximum of an immediate and each Active floating-point element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate may take the value +0.0 or +1.0 only.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if the element is a NaN, the result is a quiet NaN derived from it.
- When FPCR.DN is 1, if the element is a NaN, the result is default NaN.

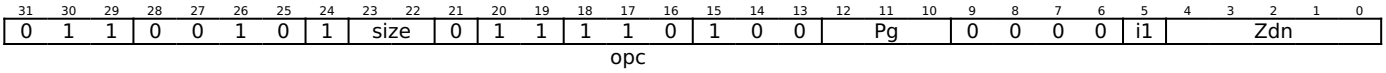
When FPCR.AH is 1, the behavior is as follows:

- If both the element and the immediate are zeros, regardless of the sign of either zero, the result is the immediate.
- If the element is a NaN, regardless of the value of FPCR.DN, the result is the immediate.

Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMAX <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let imm : bits(esize) = if i1 == '0' then Zeros{esize} else FPOne{esize}('0');
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the floating-point immediate value, encoded in “i1”:

i1	<const>
0	#0.0
1	#1.0

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = FPMax{esize}(element1, imm, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

FMAXNM (vectors)

Floating-point maximum number (predicated)

This instruction determines the maximum number value of Active floating-point elements of the first source vector and the corresponding floating-point elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector.
The behavior is as follows:

- Negative zero compares less than positive zero.
- If one element is numeric and the other is a quiet NaN, the quiet NaN element is ignored and the result is the numeric element.
- When FPCR.DN is 0, if either element is a signaling NaN or if both elements are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one element is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN element.
    - Otherwise, the result is a quiet NaN derived from the first NaN element.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN element.
- When FPCR.DN is 1, if either element is a signaling NaN or if both elements are NaNs, the result is default NaN.

Inactive elements in the destination vector register remain unmodified.

FMAXNMQV

Floating-point maximum number recursive reduction of quadword vector segments

This instruction calculates a floating-point maximum number of the same element numbers from each 128-bit source vector segment using a recursive pairwise reduction, and places each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as the default NaN.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

FMAXNMV

Floating-point maximum number recursive reduction to scalar

This instruction calculates a floating-point maximum number horizontally over all lanes of a vector using a recursive pairwise reduction, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the default NaN.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

FMIN (immediate)

Floating-point minimum with immediate (predicated)

This instruction determines the minimum of an immediate and each Active floating-point element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate may take the value +0.0 or +1.0 only.
When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if the element is a NaN, the result is a quiet NaN derived from it.
- When FPCR.DN is 1, if the element is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both the element and the immediate are zeros, regardless of the sign of either zero, the result is the immediate.
- If the element is a NaN, regardless of the value of FPCR.DN, the result is the immediate.

Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)

FMINNMV

Floating-point minimum number recursive reduction to scalar

This instruction calculates a floating-point minimum number horizontally over all lanes of a vector using a recursive pairwise reduction, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the default NaN.

The behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the quiet NaN value is ignored and the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN derived as follows:
  - If FPCR.AH is 0:
    - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
    - Otherwise, the result is a quiet NaN derived from the first NaN value.
  - If FPCR.AH is 1, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is default NaN.

FMINQV

Floating-point minimum recursive reduction of quadword vector segments

This instruction calculates a floating-point minimum of the same element numbers from each 128-bit source vector segment using a recursive pairwise reduction, and places each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as +Infinity.
When FPCR.AH is 0, the behavior is as follows:

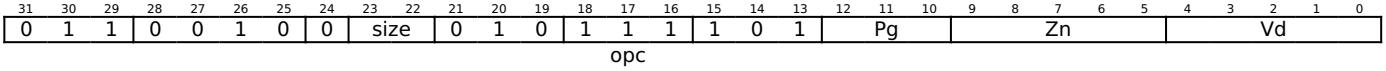
- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either value is a NaN, the result is a quiet NaN derived as follows:
  - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
  - Otherwise, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both values are zeros, regardless of the sign of either zero, the result is the second value.
- If either value is a NaN, regardless of the value of FPCR.DN, the result is the second value.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
FMINQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

Decode for this encoding

```

FMINV

Floating-point minimum recursive reduction to scalar

This instruction calculates a floating-point minimum horizontally over all lanes of a vector using a recursive pairwise reduction, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as +Infinity.

When FPCR.AH is 0, the behavior is as follows:

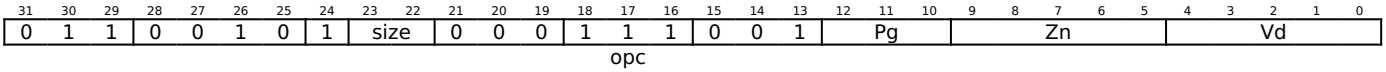
- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either value is a NaN, the result is a quiet NaN derived as follows:
  - If at least one value is a signaling NaN, the result is a quiet NaN derived from the first signaling NaN value.
  - Otherwise, the result is a quiet NaN derived from the first NaN value.
- When FPCR.DN is 1, if either value is a NaN, the result is default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both values are zeros, regardless of the sign of either zero, the result is the second value.
- If either value is a NaN, regardless of the value of FPCR.DN, the result is the second value.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMINV <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	RESERVED
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();

FMLA (indexed)

Floating-point fused multiply-add by indexed element

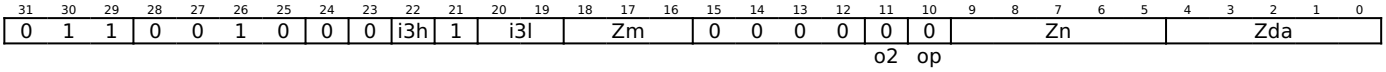
This instruction multiplies all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision , Single-precision and Double-precision

Half-precision

(FEAT_SVE || FEAT_SME)



Encoding

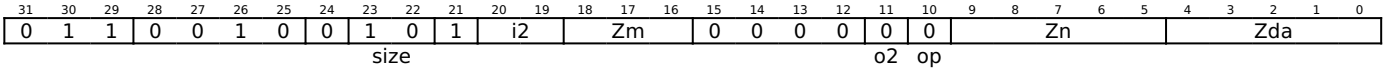
```
FMLA <Zda>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = FALSE;
let op3_neg : boolean = FALSE;
```

Single-precision

(FEAT_SVE || FEAT_SME)



Encoding

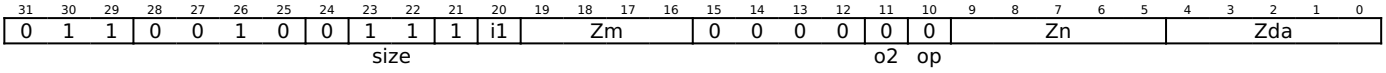
```
FMLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = FALSE;
let op3_neg : boolean = FALSE;
```

Double-precision

(FEAT_SVE || FEAT_SME)



Encoding

```
FMLA <Zda>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = FALSE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "Half-precision" and "Single-precision" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "Double-precision" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "Half-precision" variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "Single-precision" variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field. For the "Double-precision" variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let op1 : bits(VL) = Z{}(n);
let op2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let elem2 : bits(esize) = op2[s*:esize];
    let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                               else op1[e*:esize]);
    let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(result[e*:esize], FPCR())
                               else result[e*:esize]);
    result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());

end;
Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

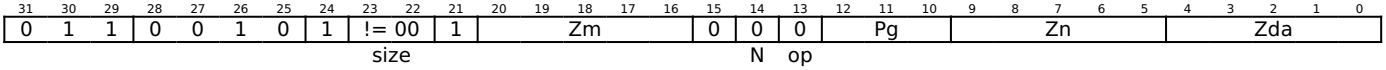
FMLA (vectors)

Floating-point fused multiply-add (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and adds the result to elements of the third source (addend) vector without intermediate rounding. The results are destructively placed in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMLA <Zda>.<T>, <Pg>/M, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = FALSE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let op1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};

FMLALB (vectors, FP8 to FP16)

8-bit floating-point multiply-add to half-precision (bottom)

This instruction widens the even 8-bit elements in the first and second source vectors to half-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$ before being destructively added without intermediate rounding to the half-precision elements of the destination vector that overlap with the corresponding 8-bit floating-point elements in the source vectors. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

SVE2

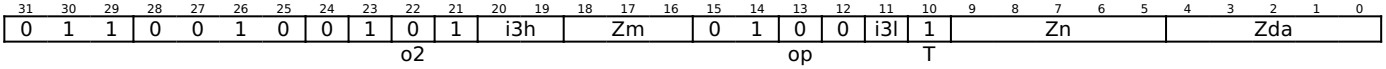
FMLALT (indexed, FP16 to FP32)

Half-precision multiply-add by indexed element to single-precision (top)

This instruction widens the odd-numbered half-precision elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the single-precision elements of the destination vector that overlap with the corresponding half-precision elements in the first source vector. This instruction is unpredicated.

Single-precision

(FEAT_SVE2 || FEAT_SME)



Encoding

```
FMLALT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

FMLALT (indexed, FP8 to FP16)

8-bit floating-point multiply-add by indexed element to half-precision (top)

This instruction widens the odd 8-bit elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to half-precision format and multiplies the corresponding elements. The intermediate products are scaled by $2^{-UInt(FPMR.LSCALE[3:0])}$ before being destructively added without intermediate rounding to the half-precision elements of the destination vector that overlap with the corresponding 8-bit floating-point elements in the first source vector. The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.
This instruction is unpredicated.

FMLS (indexed)

Floating-point fused multiply-subtract by indexed element

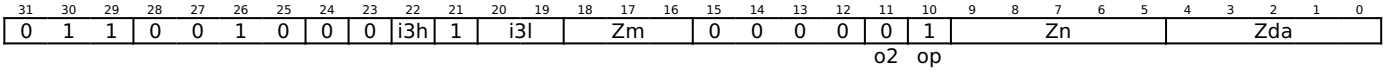
This instruction multiplies all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision , Single-precision and Double-precision

Half-precision

(FEAT_SVE || FEAT_SME)



Encoding

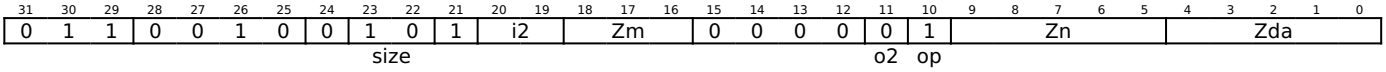
```
FMLS <Zda>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Single-precision

(FEAT_SVE || FEAT_SME)



Encoding

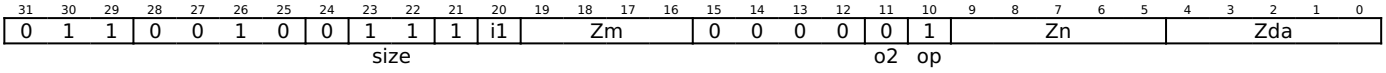
```
FMLS <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Double-precision

(FEAT_SVE || FEAT_SME)



Encoding

```
FMLS <Zda>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "Half-precision" and "Single-precision" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "Double-precision" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "Half-precision" variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "Single-precision" variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field. For the "Double-precision" variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let op1 : bits(VL) = Z{}(n);
let op2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let elem2 : bits(esize) = op2[s*:esize];
    let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                               else op1[e*:esize]);
    let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(result[e*:esize], FPCR())
                               else result[e*:esize]);
    result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());

end;
Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

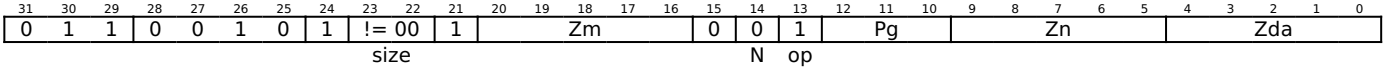
FMLS (vectors)

Floating-point fused multiply-subtract (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and subtracts the result from elements of the third source (addend) vector without intermediate rounding. The results are destructively placed in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMLS <Zda>.<T>, <Pg>/M, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let op1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let op2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let op3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                                   else op1[e*:esize]);
        let elem2 : bits(esize) = op2[e*:esize];
        let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(op3[e*:esize], FPCR())
                                   else op3[e*:esize]);

        result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());
    else
        result[e*:esize] = op3[e*:esize];

    end;
end;
Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

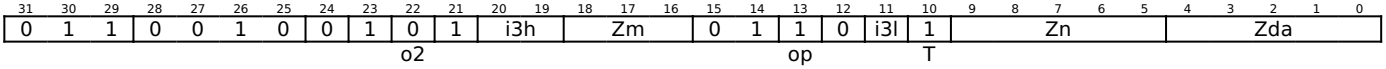
FMLSLT (indexed)

Half-precision multiply-subtract by indexed element from single-precision (top)

This instruction widens the odd-numbered half-precision elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and subtracts these values without intermediate rounding from the single-precision elements of the destination vector that overlap with the corresponding half-precision elements in the first source vector. This instruction is unpredicated.

Single-precision

(FEAT_SVE2 || FEAT_SME)



Encoding

```
FMLSLT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let index : integer = UInt(i3h::i3l);
let op1_neg : boolean = TRUE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	Is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let op1 : bits(VL) = Z{}(n);
let op2 : bits(VL) = Z{}(m);
let op3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = 2 * segmentbase + index;
    let elem1 : bits(esize DIV 2) = (if op1_neg
                                     then FPNeg{esize DIV 2}(op1[(2*e + 1)*:(esize DIV 2)], FPCR())
                                     else op1[(2*e + 1)*:(esize DIV 2)]);

FMMLA (non-widening)

Floating-point matrix multiply-accumulate

This instruction supports half-precision, single-precision, and double-precision data types in a 2x2 matrix contained in segments of 64, 128, or 256 bits, respectively. It multiplies the 2x2 matrix in each segment of the first source vector by the 2x2 matrix in the corresponding segment of the second source vector. The intermediate products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the 2x2 matrix held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated. The half-precision and single-precision variants are vector length agnostic. The double-precision variant requires that the Effective SVE vector length is at least 256 bits.

ID_AA64ZFR0_EL1.F32MM indicates whether the single-precision variant is implemented.

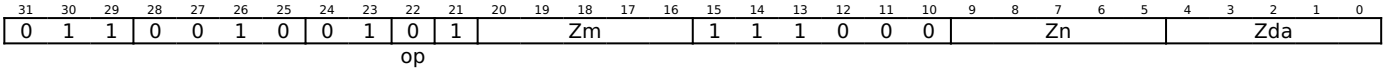
ID_AA64ZFR0_EL1.F64MM indicates whether the double-precision variant is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE2p2 && FEAT_F16MM)



Encoding

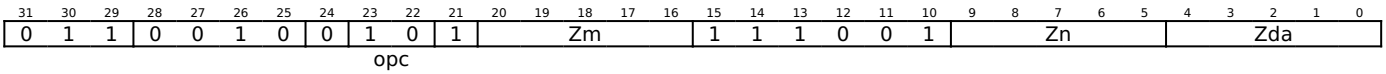
```
FMMLA <Zda>.H, <Zn>.H, <Zm>.H
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) || !IsFeatureImplemented(FEAT_F16MM) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

32-bit element

(FEAT_F32MM)



Encoding

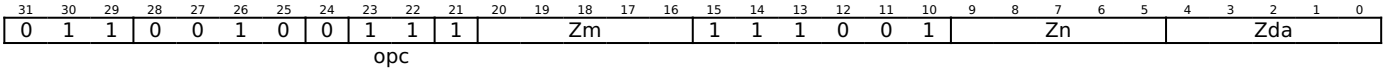
```
FMMLA <Zda>.S, <Zn>.S, <Zm>.S
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_F32MM) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

64-bit element

(FEAT_F64MM)



Encoding

```
FMMLA <Zda>.D, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_F64MM) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedVL() < 256 then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < esize * 4 then EndOfDecode(Decode_UNDEF); end;
let segments : integer = VL DIV (4 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL) = Zeros{};
var op1, op2 : bits(4*esize);
var res, addend : bits(4*esize);

for s = 0 to segments-1 do
    op1    = operand1[s*:(4*esize)];
    op2    = operand2[s*:(4*esize)];
    addend = operand3[s*:(4*esize)];
    res    = FPMatMulAdd{4*esize}(addend, op1, op2, esize, FPCR());
    result[s*:(4*esize)] = res;
end;

Z{VL}(da) = result;
```

Operational information

FMMLA (widening, FP16 to FP32)

Half-precision matrix multiply-accumulate to single-precision

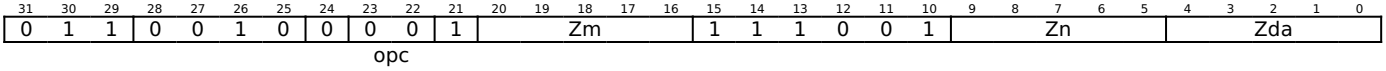
This instruction multiplies the 2×4 matrix of half-precision values held in each 128-bit segment of the first source vector by the 4×2 matrix of half-precision values in the corresponding segment of the second source vector. The intermediate single-precision results are calculated as a sum of two fused sum-of-products using two pairs of adjacent half-precision values from each of the source vectors, and rounded before accumulation into the 2×2 matrix of single-precision results in the corresponding segment of the destination vector. This is equivalent to performing a 4-way dot product per destination element.

This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE_F16F32MM)



Encoding

```
FMMLA <Zda>.S, <Zn>.H, <Zm>.H
```

Decode for this encoding

```

FMMLA (widening, FP8 to FP16)

8-bit floating-point matrix multiply-accumulate to half-precision

This instruction multiplies the 2×4 matrix of 8-bit floating-point values held in each 64-bit segment of the first source vector by the 4×2 matrix of 8-bit floating-point values in the corresponding segment of the second source vector. The intermediate half-precision results calculated as a fused sum-of-products using four adjacent 8-bit floating-point values from each of the source vectors, are scaled by $2^{-\text{UInt(FPMR.LSCALE[3:0])}}$, before being destructively added without intermediate rounding to the 2×2 half-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating 4-way dot product per destination element.

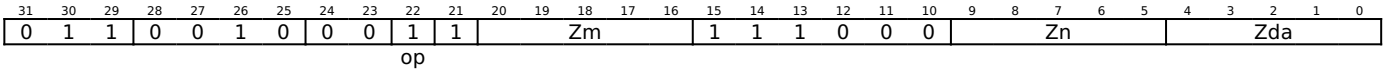
The 8-bit floating-point encoding format for the elements of the first source vector and the second source vector is selected by FPMR.F8S1 and FPMR.F8S2 respectively.

This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2 && FEAT_F8F16MM)



Encoding

```
FMMLA <Zda>.H, <Zn>.B, <Zm>.B
```

Decode for this encoding

```

FMOV (immediate, predicated)

Move floating-point immediate to vector elements (predicated)

This instruction moves a floating-point immediate into each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of FCPY. This means:

- The encodings in this description are named to match the encodings of FCPY.
- The description of FCPY gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
FMOV <Zd>.<T>, <Pg>/M, #<const>
```

is equivalent to

```
FCPY <Zd>.<T>, <Pg>/M, #<const>
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<const> Is a floating-point immediate value expressible as ±n÷16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

The description of FCPY gives the operational pseudocode for this instruction.

Operational Information

The description of FCPY gives the operational information for this instruction.

FMOV (zero, predicated)

Move floating-point +0.0 to vector elements (predicated)

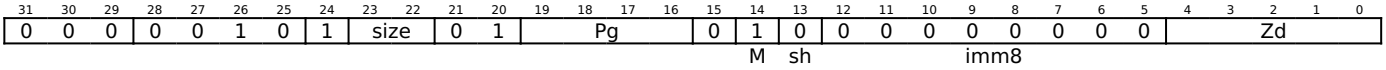
This instruction moves floating-point constant +0.0 to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is a pseudo-instruction of CPY (immediate, merging). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, merging).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CPY (immediate, merging) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMOV <Zd>.<T>, <Pg>/M, #0.0
```

is equivalent to

```
CPY <Zd>.<T>, <Pg>/M, #0
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

Operational Information

The description of CPY (immediate, merging) gives the operational information for this instruction.

FMOV (zero, unpredicated)

Move floating-point +0.0 to vector elements (unpredicated)

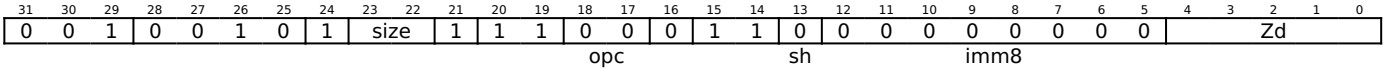
This instruction unconditionally broadcasts the floating-point constant +0.0 into each element of the destination vector. This instruction is unpredicated.

This is a pseudo-instruction of DUP (immediate). This means:

- The encodings in this description are named to match the encodings of DUP (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of DUP (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMOV <Zd>.<T>, #0.0
```

is equivalent to

```
DUP <Zd>.<T>, #0
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

Operation

The description of DUP (immediate) gives the operational pseudocode for this instruction.

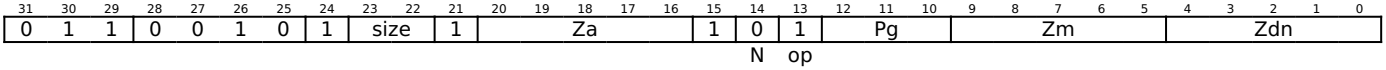
FMSB

Floating-point fused multiply-subtract to multiplicand (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and subtracts the result from elements of the third (addend) vector without intermediate rounding. The results are destructively placed in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMSB <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let a : integer = UInt(Za);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Za> Is the name of the third source scalable vector register, encoded in the "Za" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let op1 : bits(VL) = Z{}(dn);
let op2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let op3 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(a) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                                   else op1[e*:esize]);
        let elem2 : bits(esize) = op2[e*:esize];
        let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(op3[e*:esize], FPCR())
                                   else op3[e*:esize]);

        result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());
    else
        result[e*:esize] = op1[e*:esize];

    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

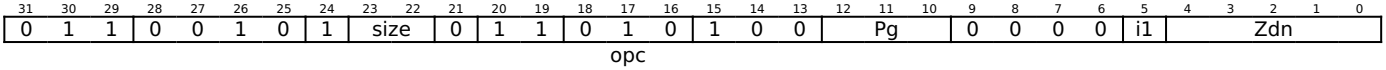
FMUL (immediate)

Floating-point multiply by immediate (predicated)

This instruction multiplies each Active floating-point element of the source vector by an immediate, and destructively places the results in the corresponding elements of the source vector. The immediate may take the value +0.5 or +2.0 only. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMUL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let imm : bits(esize) = if i1 == '0' then FPPointFive{esize}('0') else FPTwo{esize}('0');
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the floating-point immediate value, encoded in “i1”:

i1	<const>
0	#0.5
1	#2.0

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = FPMul{esize}(element1, imm, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FMUL (indexed)

Floating-point multiply by indexed element

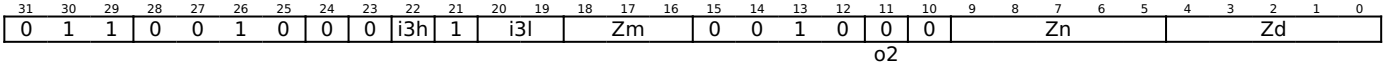
This instruction multiplies all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision , Single-precision and Double-precision

Half-precision

(FEAT_SVE || FEAT_SME)



Encoding

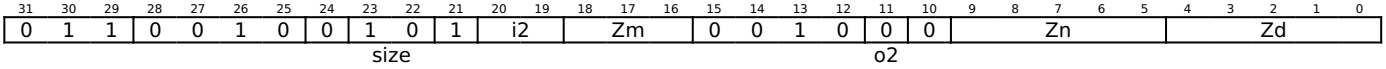
```
FMUL <Zd>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Single-precision

(FEAT_SVE || FEAT_SME)



Encoding

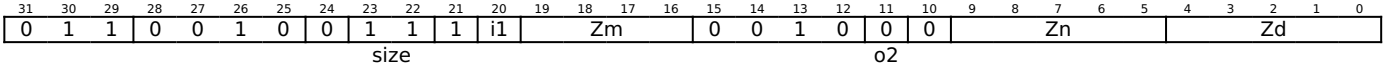
```
FMUL <Zd>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Double-precision

(FEAT_SVE || FEAT_SME)



Encoding

```
FMUL <Zd>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "Half-precision" and "Single-precision" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "Double-precision" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "Half-precision" variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "Single-precision" variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field. For the "Double-precision" variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let op1 : bits(VL) = Z{}(n);
let op2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let elem2 : bits(esize) = op2[s*:esize];
    let elem1 : bits(esize) = op1[e*:esize];
    result[e*:esize] = FPMul{esize}(elem1, elem2, FPCR());

end;
Z{VL}(d) = result;
```

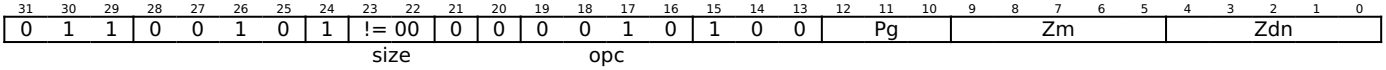
FMUL (vectors, predicated)

Floating-point multiply (predicated)

This instruction multiplies Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMUL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);

let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPMul{esize}(element1, element2, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

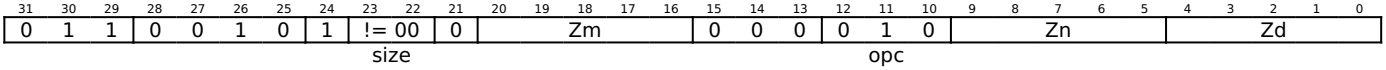
FMUL (vectors, unpredicated)

Floating-point multiply (unpredicated)

This instruction multiplies all elements of the first source vector by the corresponding floating-point elements of the second source vector and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPMul{esize}(element1, element2, FPCR());
end;

Z{VL}(d) = result;
```

FMULX

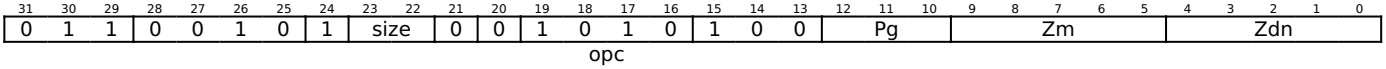
Floating-point multiply extended (predicated)

This instruction multiplies Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector except that ∞×0.0 gives 2.0 instead of NaN, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

The instruction can be used with FRECPX to safely convert arbitrary elements in mathematical vector space to unit vectors or direction vectors with length 1.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FMULX <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);

let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPMulX{esize}(element1, element2, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FNEG

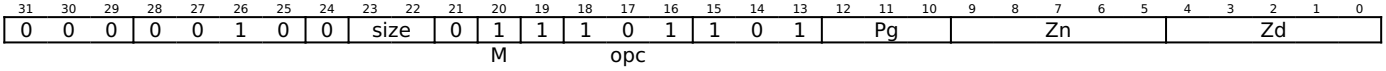
Floating-point negate (predicated)

This instruction negates each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. This inverts the sign bit and cannot signal a floating-point exception. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

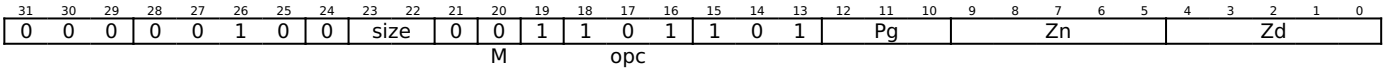
```
FNEG <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FNEG <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPNeg{esize}(element, FPCR());

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

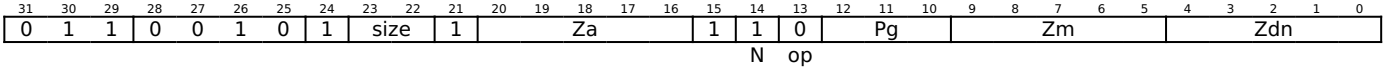
FNMAD

Floating-point negated fused multiply-add to multiplicand (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and adds the result to elements of the third (addend) vector without intermediate rounding. The negated results are destructively placed in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FNMAD <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let a : integer = UInt(Za);
let op1_neg : boolean = TRUE;
let op3_neg : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Za> Is the name of the third source scalable vector register, encoded in the "Za" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let op1 : bits(VL) = Z{}(dn);
let op2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let op3 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(a) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let elem1 : bits(esize) = (if op1_neg then FPNeg{esize}(op1[e*:esize], FPCR())
                                   else op1[e*:esize]);
        let elem2 : bits(esize) = op2[e*:esize];
        let elem3 : bits(esize) = (if op3_neg then FPNeg{esize}(op3[e*:esize], FPCR())
                                   else op3[e*:esize]);

        result[e*:esize] = FPMulAdd{esize}(elem3, elem1, elem2, FPCR());
    else
        result[e*:esize] = op1[e*:esize];

    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

    else
        result[e*:esize] = op3[e*:esize];

    end;
end;
Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

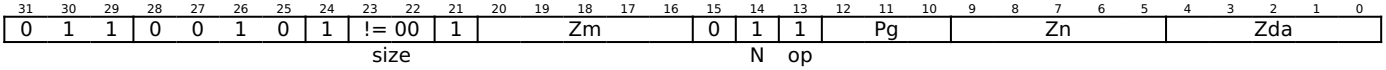
FNMLS

Floating-point negated fused multiply-subtract (predicated)

This instruction multiplies the Active floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, and subtracts the result from elements of the third source (addend) vector without intermediate rounding. The negated results are destructively placed in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FNMLS <Zda>.<T>, <Pg>/M, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```

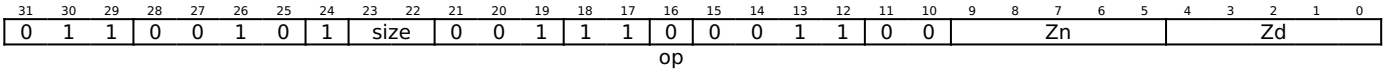
FRECPE

Floating-point reciprocal estimate (unpredicated)

This instruction finds the approximate reciprocal of each floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FRECPE <Zd>.<T>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand : bits(VL) = Z{}(n);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : bits(esize) = operand[e*:esize];
    result[e*:esize] = FPRecipEstimate{esize}(element, FPCR());
end;

Z{VL}(d) = result;
```

FRECPS

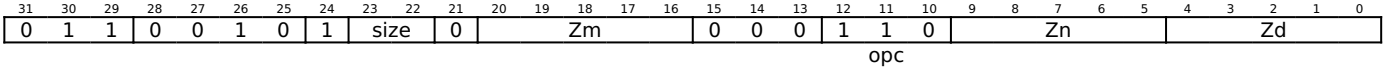
Floating-point reciprocal step (unpredicated)

This instruction multiplies the floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, subtracts the products from 2.0 without intermediate rounding, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal of a vector of floating-point values.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FRECPS <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPRecipStepFused{esize}(element1, element2, FPCR());
end;

Z{VL}(d) = result;
```

FRECPX

Floating-point reciprocal exponent (predicated)

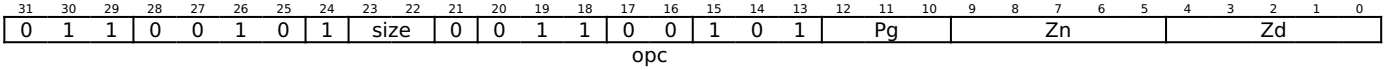
This instruction inverts the exponent, zeroes the fractional part of each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

The result of this instruction can be used with FMULX to convert arbitrary elements in mathematical vector space to "unit vectors" or "direction vectors" of length 1.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

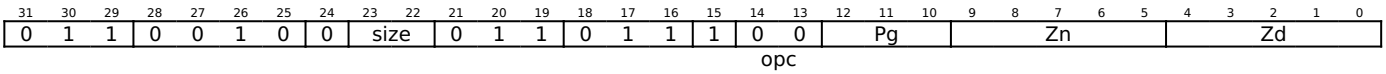
```
FRECPX <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FRECPX <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPRecpX{esize}(element, FPCR());
    end;
end;

Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

        result[e*:esize] = FPRoundIntN{esize}(element, FPCR(), rounding, intsize);
    end;
end;

Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

FRINT64Z

Floating-point round to 64-bit integer, rounding toward zero (predicated)

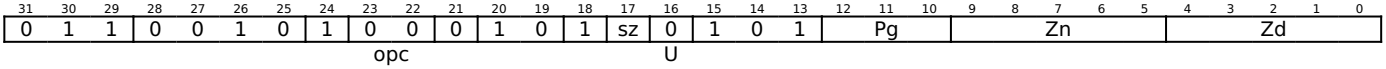
This instruction rounds to integral floating-point values that fit into a 64-bit integer size using the round towards zero rounding mode from each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector.

Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

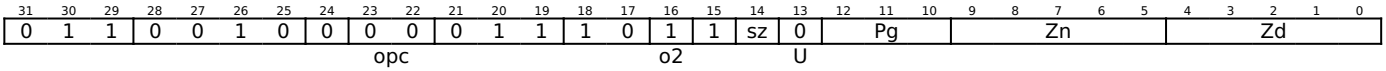
```
FRINT64Z <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let intsize : integer{} = 64;
let rounding : FPRounding = FPRounding_ZERO;
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FRINT64Z <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let intsize : integer{} = 64;
let rounding : FPRounding = FPRounding_ZERO;
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPRoundIntN{esize}(element, FPCR(), rounding, intsize);
    end;
end;

Z{VL}(d) = result;
```

FRINT<r>

Floating-point round to integral value (predicated)

This instruction rounds to an integral floating-point value with the specified rounding option from each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

<r>	Rounding Option
N	to nearest, with ties to even
A	to nearest, with ties away from zero
M	toward minus Infinity
P	toward plus Infinity
Z	toward zero
I	current FPCR rounding mode
X	current FPCR rounding mode, signaling inexact

It has encodings from 14 classes: Current mode signaling inexact, merging , Current mode signaling inexact, zeroing , Current mode, merging , Current mode, zeroing , Nearest with ties to away, merging , Nearest with ties to away, zeroing , Nearest with ties to even, merging , Nearest with ties to even, zeroing , Toward zero, merging , Toward zero, zeroing , Toward minus infinity, merging , Toward minus infinity, zeroing , Toward plus infinity, merging and Toward plus infinity, zeroing

FRSQRTS

Floating-point reciprocal square root step (unpredicated)

This instruction multiplies the floating-point elements of the first source vector by the corresponding floating-point elements of the second source vector, subtracts the products from 3.0 and divides the results by 2.0 without any intermediate rounding, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal square root of a vector of floating-point values.

FSQRT

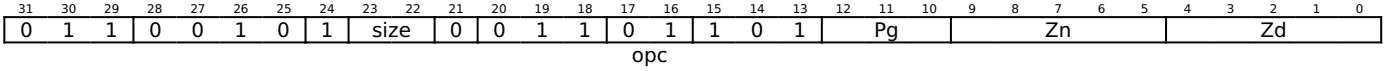
Floating-point square root (predicated)

This instruction calculates the square root of each Active floating-point element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

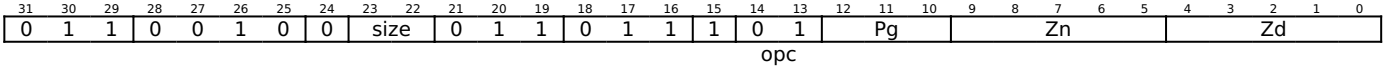
```
FSQRT <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
FSQRT <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = FPSqrt{esize}(element, FPCR());
    end;
end;

Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

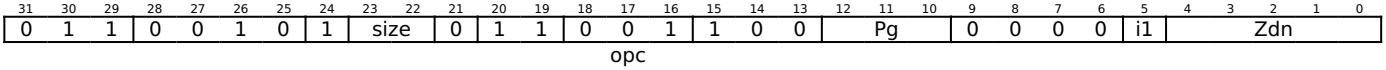
FSUB (immediate)

Floating-point subtract immediate (predicated)

This instruction subtracts an immediate from each Active floating-point element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate may take the value +0.5 or +1.0 only. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FSUB <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let imm : bits(esize) = if i1 == '0' then FPPointFive{esize}('0') else FPOne{esize}('0');
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the floating-point immediate value, encoded in “i1”:

i1	<const>
0	#0.5
1	#1.0

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = FPSub{esize}(element1, imm, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

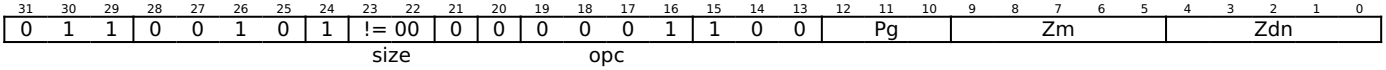
FSUB (vectors, predicated)

Floating-point subtract (predicated)

This instruction subtracts Active floating-point elements of the second source vector from the corresponding floating-point elements of the first source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FSUB <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);

let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element2 : bits(esize) = operand2[e*:esize];
        result[e*:esize] = FPSub{esize}(element1, element2, FPCR());
    else
        result[e*:esize] = element1;
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

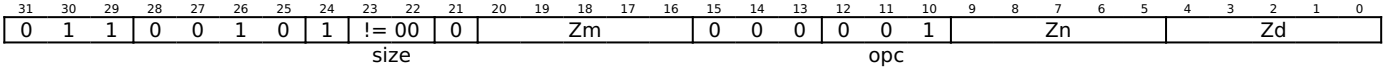
FSUB (vectors, unpredicated)

Floating-point subtract (unpredicated)

This instruction subtracts all floating-point elements of the second source vector from the corresponding elements of the first source vector, and places the results in the corresponding elements of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
FSUB <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPSub{esize}(element1, element2, FPCR());
end;

Z{VL}(d) = result;
```

FTMAD

Floating-point trigonometric multiply-add coefficient

This instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and destructively places the results in the first source vector. This instruction is unpredicated.

The coefficients are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

`FTMAD` can be combined with `FTSMUL` and `FTSSEL` to calculate values for sin(x) and cos(x). For more information, see `FTSMUL`. The coefficients are intended to provide accurate results for `FTSMUL` inputs in the range $-\pi/4 < x \leq \pi/4$.

For double-precision operations, the coefficients are:

element2<63>	Index	Hexadecimal	Approximate value
0	0	0x3FF0000000000000	1
0	1	0xBFC5555555555543	-1/3!
0	2	0x3F8111111110F30C	1/5!
0	3	0xBF2A01A019B92FC6	-1/7!
0	4	0x3EC71DE351F3D22B	1/9!
0	5	0xBE5AE5E2B60F7B91	-1/11!
0	6	0x3DE5D8408868552F	1/13!
0	7	0x0000000000000000	0
1	0	0x3FF0000000000000	1
1	1	0xBFE0000000000000	-1/2!
1	2	0x3FA5555555555536	1/4!
1	3	0xBF56C16C16C13A0B	-1/6!
1	4	0x3EFA01A019B1E8D8	1/8!
1	5	0xBE927E4F7282F468	-1/10!
1	6	0x3E21EE96D2641B13	1/12!
1	7	0xBDA8F76380FBB401	-1/14!

For single-precision operations, the coefficients are:

element2<63>	Index	Hexadecimal	Approximate value
0	0	0x3F800000	1
0	1	0xBE2AAAAB	-1/3!
0	2	0x3C088886	1/5!
0	3	0xB95008B9	-1/7!
0	4	0x36369D6D	1/9!
0	5	0x00000000	0
0	6	0x00000000	0
0	7	0x00000000	0
1	0	0x3F800000	1
1	1	0xBF000000	-1/2!
1	2	0x3D2AAAA6	1/4!
1	3	0xBAB60705	-1/6!
1	4	0x37CD37CC	1/8!
1	5	0x00000000	0
1	6	0x00000000	0
1	7	0x00000000	0

For half-precision operations, the coefficients are:

element2<63>	Index	Hexadecimal	Approximate value
0	0	0x3C00	1
0	1	0xB155	-1/3!
0	2	0x2030	1/5!
0	3	0x0000	0
0	4	0x0000	0
0	5	0x0000	0
0	6	0x0000	0
0	7	0x0000	0
1	0	0x3C00	1
1	1	0xB800	-1/2!

element2<63>	Index	Hexadecimal	Approximate value
1	2	0x293A	1/4!
1	3	0x0000	0
1	4	0x0000	0
1	5	0x0000	0
1	6	0x0000	0
1	7	0x0000	0

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)

Encoding

```
FTMAD <Zdn>.<T>, <Zdn>.<T>, <Zm>.<T>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let imm : integer = UInt(imm3);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<imm> Is the unsigned immediate operand, in the range 0 to 7, encoded in the "imm3" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPTrigMAdd{esize}(imm, element1, element2, FPCR());
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FTSMUL

Floating-point trigonometric starting value

This instruction multiplies each element of the first source vector by itself, replaces the sign-bit of each product with the least-significant bit of the corresponding element of the second source vector, and places the results in the destination vector. This instruction is unpredicated.

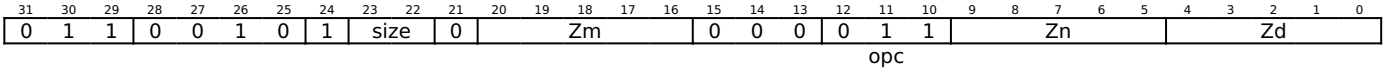
FTSMUL can be combined with FTMAD and FTSSEL to calculate values for sin(x) and cos(x). The use of the second operand is consistent with it holding an integer corresponding to the desired sine-wave quadrant when used in conjunction with FTMAD.

Note: FTSMUL, FTMAD, and FTSSEL can be used to calculate values for sin(k) and correspondingly cos(k-π/2) using an intermediate value x, in the range $-\pi/4 < x \leq \pi/4$, and a quadrant q where $k = q\pi/2 + x$, using a Taylor Series approximation. FTSMUL can be used to calculate x^2, and to insert q<0> into the most-significant bit, indicating the desired odd versus even Taylor Series to be used in FTMAD. Repeated uses of FTMAD can be performed on this value with decreasing immediate index operands, to produce a single accumulated value approximating the Taylor Series result with a single outstanding factor. FTSSEL can be used to apply the final factor of x, 1.0, -x, or -1.0, dependent on the corresponding sine-wave quadrant q<1:0>, to produce a final sin() or cos() value.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
FTSMUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPTrigSMul{esize}(element1, element2, FPCR());
end;

Z{VL}(d) = result;
```

FTSSEL

Floating-point trigonometric select coefficient

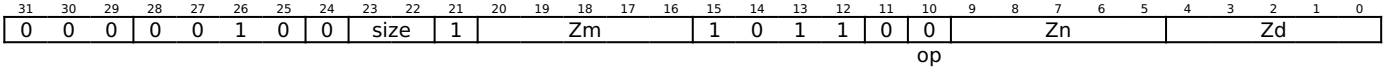
This instruction selects either the element of the first source vector or the value 1.0, based on bit<0> of the corresponding element of the second source element, negates the result if bit<1> of the corresponding element of the second source element is set, and places the results in the destination vector. This instruction is unpredicated.

FTSSEL can be combined with FTSMUL and FTMAD to calculate values for sin(k) and cos(k). For more information, see FTSMUL. The use of the second operand is consistent with it holding an integer corresponding to the desired sine-wave quadrant.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
FTSSEL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    result[e*:esize] = FPTrigSSel{esize}(element1, element2);
end;

Z{VL}(d) = result;
```

HISTCNT

Count matching elements in vector

This instruction compares each Active 32 or 64-bit element of the first source vector with all Active elements with an element number less than or equal to its own in the second source vector, and places the count of matching elements in the corresponding element of the destination vector. Inactive elements in the destination vector are set to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2)

Encoding

```
HISTCNT <Zd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
if size IN {'0x'} then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let d : integer = UInt(Zd);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    var count : integer = 0;
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : bits(esize) = operand1[e*:esize];
        for i = 0 to e do
            if ActivePredicateElement{PL}(mask, i, esize) then
                let element2 : bits(esize) = operand2[i*:esize];
                if element1 == element2 then
                    count = count + 1;
                end;
            end;
        end;
    end;
    result[e*:esize] = count[esize-1:0];
end;

Z{VL}(d) = result;
```

HISTSEG

Count matching elements in vector segments

This instruction compares each 8-bit byte element of the first source vector with all of the elements in the corresponding 128-bit segment of the second source vector and places the count of matching elements in the corresponding element of the destination vector. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2)

Encoding

```
HISTSEG <Zd>.B, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
if size != '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8;
let d : integer = UInt(Zd);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for b = 0 to segments-1 do
    for s = 0 to eltspersegment-1 do
        var count : integer = 0;
        let e : integer = eltspersegment * b + s;
        let element1 : bits(esize) = operand1[e*:esize];
        for i = 0 to eltspersegment-1 do
            let e2 : integer = eltspersegment * b + i;
            let element2 : bits(esize) = operand2[e2*:esize];
            if element1 == element2 then
                count = count + 1;
            end;
        end;
        result[e*:esize] = count[esize-1:0];
    end;
end;

Z{VL}(d) = result;
```

INCB, INCD, INCH, INCW (scalar)

Increment scalar by multiple of predicate constraint element count

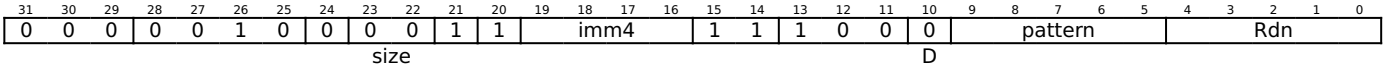
This instruction determines the number of Active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 4 classes: Byte , Doubleword , Halfword and Word

Byte

(FEAT_SVE || FEAT_SME)



Encoding

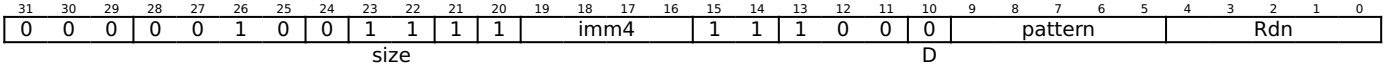
```
INCB <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Doubleword

(FEAT_SVE || FEAT_SME)



Encoding

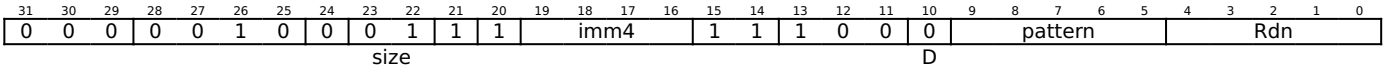
```
INCD <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Halfword

(FEAT_SVE || FEAT_SME)



Encoding

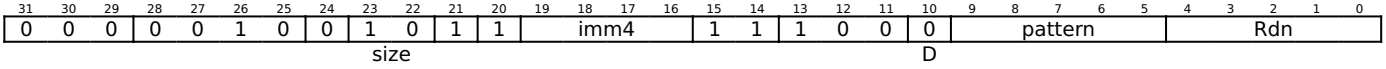
```
INCH <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Word

(FEAT_SVE || FEAT_SME)



Encoding

```
INCW <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let count : integer = DecodePredCount(pat, esize);
let VL : integer{} = CurrentVL();
let operand1 : bits(64) = X{}(dn);
X{64}(dn) = operand1 + (count * imm);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    result[e*:esize] = operand1[e*:esize] + (count * imm);

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

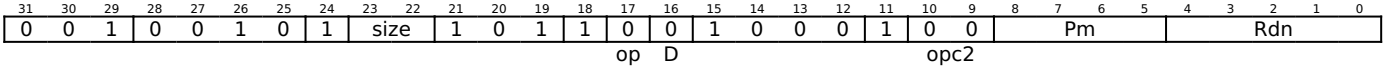
INCP (scalar)

Increment scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to increment the scalar destination.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
INCP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(64) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

X{64}(dn) = operand1 + count;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

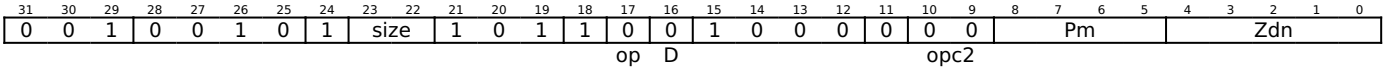
INCP (vector)

Increment vector by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to increment all destination vector elements. The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
INCP <Zdn>.<T>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(VL);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

for e = 0 to elements-1 do
    result[e*:esize] = operand1[e*:esize] + count;

end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

INDEX (immediate, scalar)

Create index starting from immediate and incremented by general-purpose register

This instruction populates the destination vector by setting the first element to the first signed immediate integer operand and monotonically incrementing the value by the second signed scalar integer operand for each subsequent element. The scalar source operand is a general-purpose register in which only the least significant bits corresponding to the vector element size are used and any remaining bits are ignored. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
INDEX <Zd>.<T>, #<imm>, <R><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Rm);
let d : integer = UInt(Zd);
let imm : integer = SInt(imm5);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand2 : bits(esize) = X{}(m);
let element2 : integer = SInt(operand2);
var result : bits(VL);

for e = 0 to elements-1 do
    let index : integer = imm + e * element2;
    result[e*:esize] = index[esize-1:0];
end;

Z{VL}(d) = result;
```

INDEX (immediates)

Create index starting from and incremented by immediate

This instruction populates the destination vector by setting the first element to the first signed immediate integer operand and monotonically incrementing the value by the second signed immediate integer operand for each subsequent element. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
INDEX <Zd>.<T>, #<imm1>, #<imm2>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Zd);
let imm1 : integer = SInt(imm5);
let imm2 : integer = SInt(imm5b);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm1> Is the first signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.

<imm2> Is the second signed immediate operand, in the range -16 to 15, encoded in the "imm5b" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
var result : bits(VL);

for e = 0 to elements-1 do
    let index : integer = imm1 + e * imm2;
    result[e*:esize] = index[esize-1:0];
end;

Z{VL}(d) = result;
```

INDEX (scalars)

Create index starting from and incremented by general-purpose register

This instruction populates the destination vector by setting the first element to the first signed scalar integer operand and monotonically incrementing the value by the second signed scalar integer operand for each subsequent element. The scalar source operands are general-purpose registers in which only the least significant bits corresponding to the vector element size are used and any remaining bits are ignored. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
INDEX <Zd>.<T>, <R><n>, <R><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<n> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rn" field.

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(esize) = X{}(n);
let element1 : integer = SInt(operand1);
let operand2 : bits(esize) = X{}(m);
let element2 : integer = SInt(operand2);
var result : bits(VL);

for e = 0 to elements-1 do
    let index : integer = element1 + e * element2;
    result[e*:esize] = index[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

INSR (scalar)

Insert general-purpose register in shifted vector

This instruction shifts the destination vector left by one element, and then places a copy of the least-significant bits of the general-purpose register in element 0 of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
INSR <Zdn>.<T>, <R><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Rm);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let dest : bits(VL) = Z{}(dn);
let src : bits(esize) = X{}(m);
Z{VL}(dn) = dest[(VL-esize)-1:0] :: src;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

INSR (SIMD&FP scalar)

Insert SIMD&FP scalar register in shifted vector

This instruction shifts the destination vector left by one element, and then places a copy of the SIMD&FP scalar register in element 0 of the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
INSR <Zdn>.<T>, <V><m>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Vm);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<m> Is the number [0-31] of the source SIMD&FP register, encoded in the "Vm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let dest : bits(VL) = Z{}(dn);
let src : bits(esize) = V{}(m);
Z{VL}(dn) = dest[(VL-esize)-1:0] :: src;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

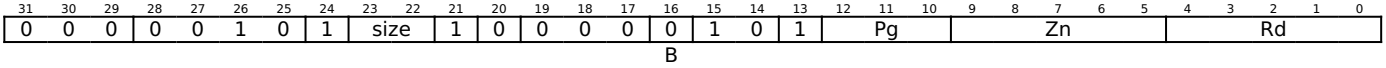
LASTA (scalar)

Extract element after last to general-purpose register

This instruction extracts the element after the Last active element to a general-purpose register. If there is an Active element, the element after the Last active element modulo the number of elements from the final source vector register is extracted. If there are no Active elements, element zero is extracted. Then the extracted element is zero-extended and placed in the destination general-purpose register.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LASTA <R><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let rsize : integer{} = if esize < 64 then 32 else 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Rd);
let isBefore : boolean = FALSE;
```

Assembler Symbols

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<d> Is the number [0-30] of the destination general-purpose register or the name ZR (31), encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = Z{}(n);
var result : bits(rsize);
var last : integer = LastActiveElement{PL}(mask, esize);

if isBefore then
    if last < 0 then last = elements - 1; end;
else
    last = last + 1;
    if last >= elements then last = 0; end;
end;
result = ZeroExtend{rsize}(operand[last*:esize]);

X{rsize}(d) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

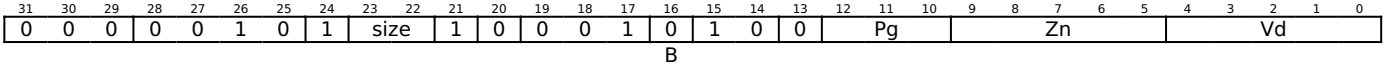
LASTA (SIMD&FP scalar)

Extract element after last to SIMD&FP scalar register

This instruction extracts the element after the Last active element to a SIMD&FP scalar register. If there is an Active element, the element after the Last active element modulo the number of elements from the final source vector register is extracted. If there are no Active elements, element zero is extracted. Then the extracted element is placed in the destination SIMD&FP scalar register.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LASTA <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
let isBefore : boolean = FALSE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = Z{}(n);
var last : integer = LastActiveElement{PL}(mask, esize);

if isBefore then
    if last < 0 then last = elements - 1; end;
else
    last = last + 1;
    if last >= elements then last = 0; end;
end;
V{esize}(d) = operand[last*:esize];
```

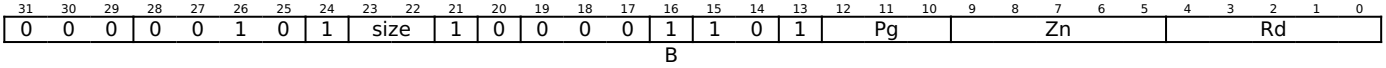
LASTB (scalar)

Extract last element to general-purpose register

This instruction extracts the Last active element to a general-purpose register. If there is an Active element, the Last active element from the final source vector register is extracted. If there are no Active elements, the highest-numbered element is extracted. Then the extracted element is zero-extended and placed in the destination general-purpose register.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LASTB <R><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let rsize : integer{} = if esize < 64 then 32 else 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Rd);
let isBefore : boolean = TRUE;
```

Assembler Symbols

<R> Is a width specifier, encoded in “size”:

size	<R>
00	W
01	W
10	W
11	X

<d> Is the number [0-30] of the destination general-purpose register or the name ZR (31), encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H

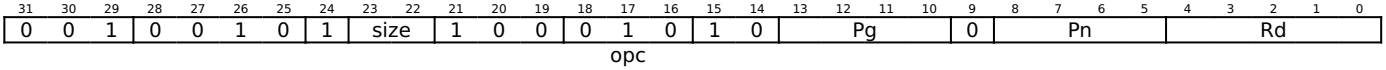
LASTP

Scalar index of last true predicate element (predicated)

This instruction determines the index of the Last active and true element of the source predicate, and places the scalar result in the destination general-purpose register. If there are no Active and true elements, the destination general-purpose register is updated to the value minus one.

SVE2

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
LASTP <Xd>, <Pg>, <Pn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let d : integer = UInt(Rd);
```

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(PL) = P{}(n);
var index : integer = -1;

for e = elements-1 downto 0 do
    if (index == -1 && ActivePredicateElement{PL}(mask, e, esize) &&
          ActivePredicateElement{PL}(operand, e, esize)) then
        index = e;
    end;
end;

X{64}(d) = index[63:0];
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

LD1B (scalar plus immediate, consecutive registers)

Contiguous load of bytes to multiple consecutive vectors (immediate index)

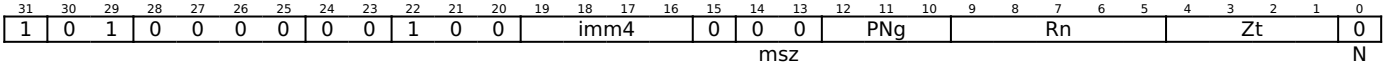
This instruction performs a contiguous load of unsigned bytes to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

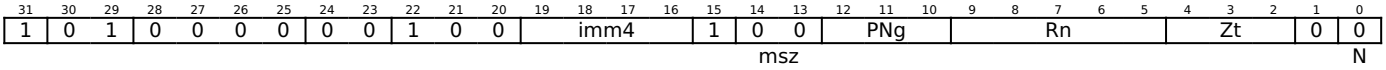
```
LD1B { <Zt1>.B-<Zt2>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1B { <Zt1>.B-<Zt4>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();

LD1B (scalar plus immediate, single register)

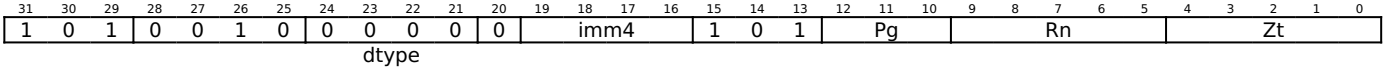
Contiguous load unsigned bytes to vector (immediate index)

This instruction performs a contiguous load of unsigned bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 4 classes: 8-bit element , 16-bit element , 32-bit element and 64-bit element

8-bit element

(FEAT_SVE || FEAT_SME)



Encoding

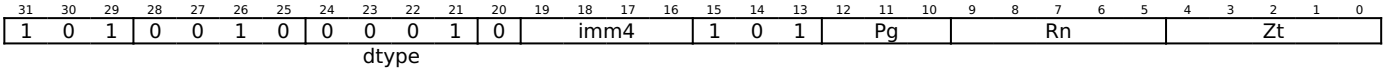
```
LD1B { <Zt>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

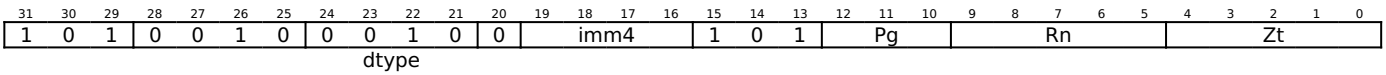
```
LD1B { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

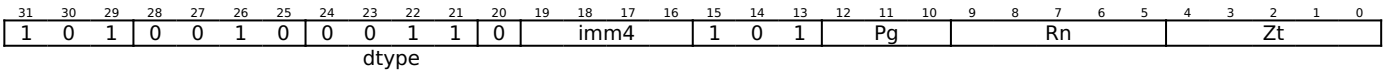
```
LD1B { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1B { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;

LD1B (scalar plus scalar, consecutive registers)

Contiguous load of bytes to multiple consecutive vectors (scalar index)

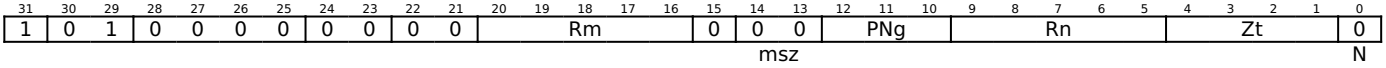
This instruction performs a contiguous load of unsigned bytes to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

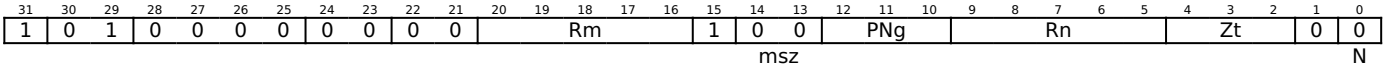
```
LD1B { <Zt1>.B-<Zt2>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1B { <Zt1>.B-<Zt4>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

LD1B (scalar plus vector)

Gather load unsigned bytes to vector (vector index)

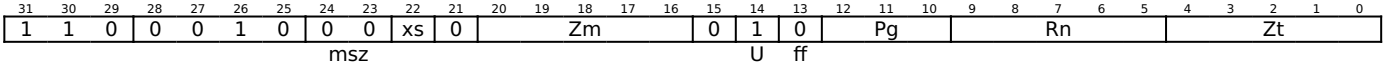
This instruction performs a gather load of unsigned bytes to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign-extended or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 32-bit unpacked unscaled offset , 32-bit unscaled offset and 64-bit unscaled offset

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

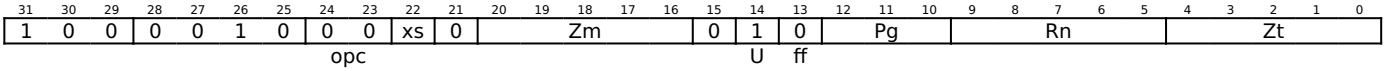
```
LD1B { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

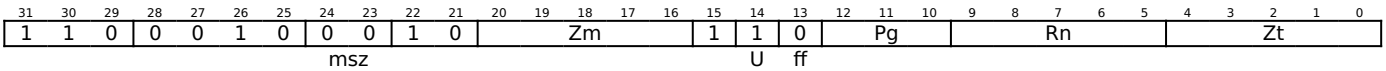
```
LD1B { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1B { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 64;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

Operation

LD1D (scalar plus immediate, consecutive registers)

Contiguous load of doublewords to multiple consecutive vectors (immediate index)

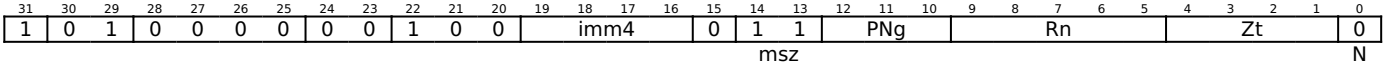
This instruction performs a contiguous load of unsigned doublewords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

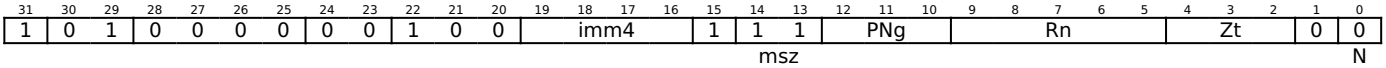
```
LD1D { <Zt1>.D-<Zt2>.D }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1D { <Zt1>.D-<Zt4>.D }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);

LD1D (scalar plus immediate, single register)

Contiguous load unsigned doublewords to vector (immediate index)

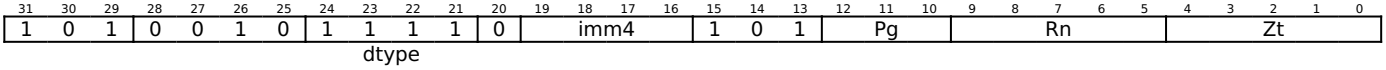
This instruction performs a contiguous load of unsigned doublewords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

The 128-bit element variant is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 64-bit element and 128-bit element

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

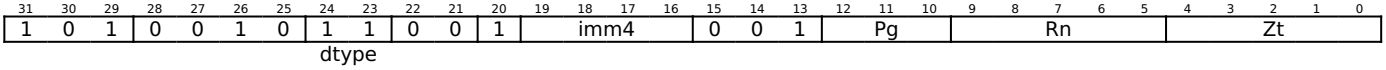
```
LD1D { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

128-bit element

(FEAT_SVE2p1)



Encoding

```
LD1D { <Zt>.Q }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 128;
let msize : integer{} = 64;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

Operation

```
if esize < 128 then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;

LD1D (scalar plus scalar, consecutive registers)

Contiguous load of doublewords to multiple consecutive vectors (scalar index)

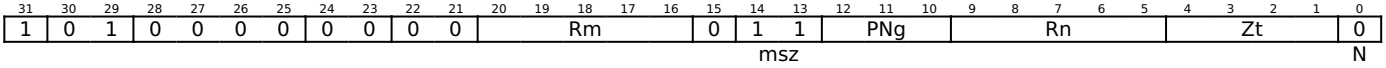
This instruction performs a contiguous load of unsigned doublewords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

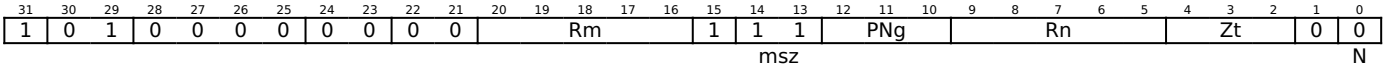
```
LD1D { <Zt1>.D-<Zt2>.D }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 64;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1D { <Zt1>.D-<Zt4>.D }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 64;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```

LD1D (vector plus immediate)

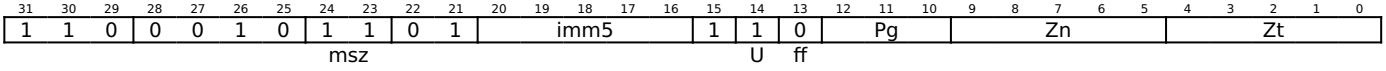
Gather load doublewords to vector (immediate index)

This instruction performs a gather load of doublewords to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 8 in the range 0 to 248. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
LD1D { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 248, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var result : bits(VL);
var data : bits(msize);

LD1H (scalar plus immediate, consecutive registers)

Contiguous load of halfwords to multiple consecutive vectors (immediate index)

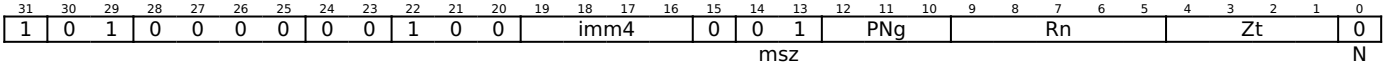
This instruction performs a contiguous load of unsigned halfwords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

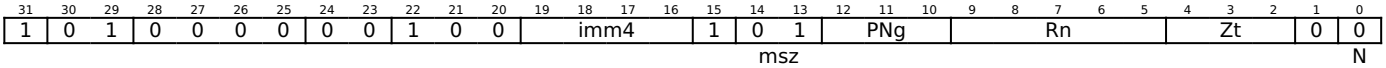
```
LD1H { <Zt1>.H-<Zt2>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1H { <Zt1>.H-<Zt4>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else

LD1H (scalar plus immediate, single register)

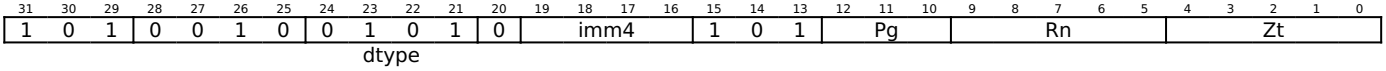
Contiguous load unsigned halfwords to vector (immediate index)

This instruction performs a contiguous load of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

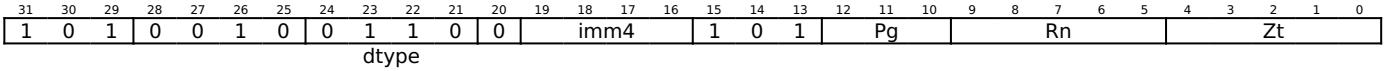
```
LD1H { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

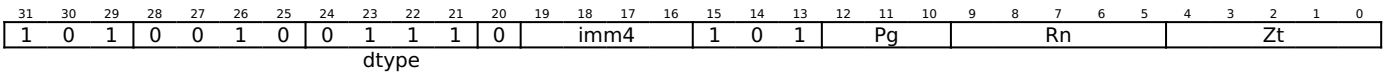
```
LD1H { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1H { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

Operation

LD1H (scalar plus scalar, consecutive registers)

Contiguous load of halfwords to multiple consecutive vectors (scalar index)

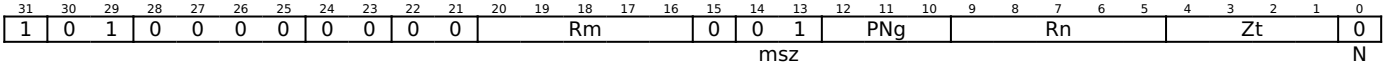
This instruction performs a contiguous load of unsigned halfwords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

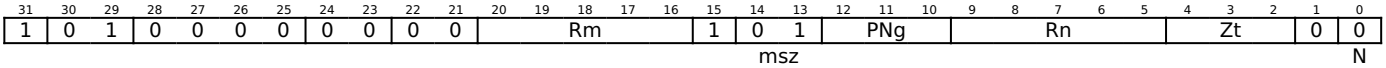
```
LD1H { <Zt1>.H-<Zt2>.H }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 16;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1H { <Zt1>.H-<Zt4>.H }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 16;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```

LD1H (scalar plus vector)

Gather load unsigned halfwords to vector (vector index)

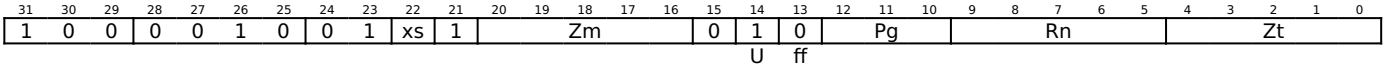
This instruction performs a gather load of unsigned halfwords to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

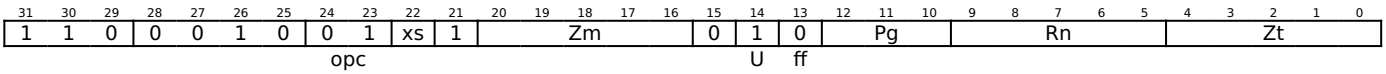
```
LD1H { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

```
LD1H { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);

LD1Q

Gather load quadwords

This instruction performs a gather load of quadwords to Active elements of a vector register from memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2p1)

Encoding

```
LD1Q { <Zt>.Q }, <Pg>/Z, [<Zn>.D{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<Xm>	Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
CheckNonStreamingSVEEnabled();
let elements : integer = VL DIV 128;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var offset : bits(64);
var result : bits(VL);
let contiguous : boolean = FALSE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);

if AnyActiveElement{PL}(mask, 128) then
    base = Z{VL}(n);
    offset = X{64}(m);
end;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, 128) then
        let baddr : bits(64) = base[(2*e)*:64];
        let addr : bits(64) = AddressAdd(baddr, offset, accdesc);
        result[e*:128] = Mem{128}(addr, accdesc);
    else
        result[e*:128] = Zeros{128};
    end;
end;

Z{VL}(t) = result;
```

LD1RB

Load and broadcast unsigned byte to vector

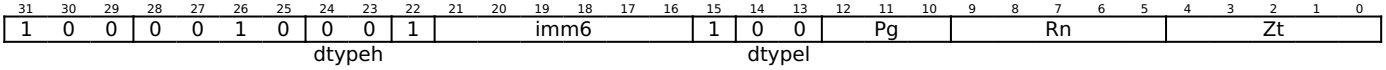
This instruction loads a single unsigned byte from a memory address generated by a 64-bit scalar base address plus an immediate offset that is in the range 0 to 63.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 4 classes: 8-bit element , 16-bit element , 32-bit element and 64-bit element

8-bit element

(FEAT_SVE || FEAT_SME)



Encoding

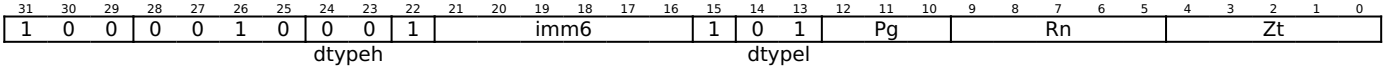
```
LD1RB { <Zt>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

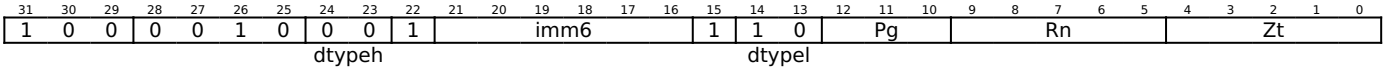
```
LD1RB { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

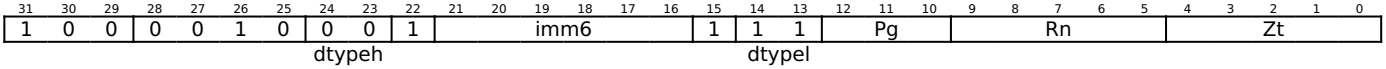
```
LD1RB { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RB { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, in the range 0 to 63, defaulting to 0, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);

LD1RD

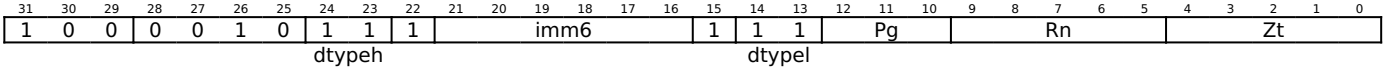
Load and broadcast doubleword to vector

This instruction loads a single doubleword from a memory address generated by a 64-bit scalar base address plus an immediate offset that is a multiple of 8 in the range 0 to 504.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RD { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 504, defaulting to 0, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);

LD1RH

Load and broadcast unsigned halfword to vector

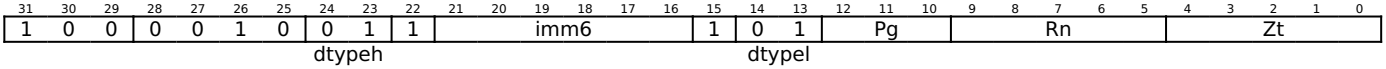
This instruction loads a single unsigned halfword from a memory address generated by a 64-bit scalar base address plus an immediate offset that is a multiple of 2 in the range 0 to 126.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

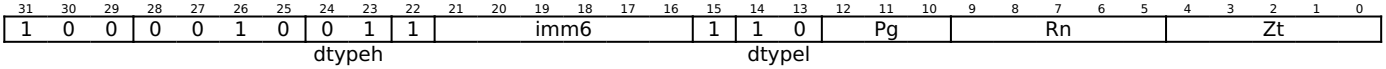
```
LD1RH { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

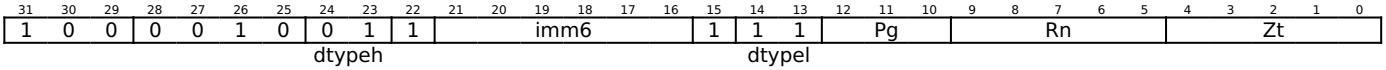
```
LD1RH { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RH { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 2 in the range 0 to 126, defaulting to 0, encoded in the "imm6" field.

Operation

LD1ROB (scalar plus immediate)

Contiguous load and replicate thirty-two bytes (immediate index)

This instruction loads thirty-two contiguous bytes to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the Effective SVE vector length is at least 256 bits.

Only the first thirty-two predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

LD1ROD (scalar plus scalar)

Contiguous load and replicate four doublewords (scalar index)

This instruction loads four contiguous doublewords to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and scalar index that is multiplied by 8 and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the Effective SVE vector length is at least 256 bits.

Only the first four predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

LD1RQD (scalar plus immediate)

Contiguous load and replicate two doublewords (immediate index)

This instruction loads two contiguous doublewords to elements of a short, 128-bit (quadword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 16 in the range -128 to +112 added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero. The resulting short vector is then replicated to fill the long destination vector. Only the first two predicate elements are used and higher numbered predicate elements are ignored.

SVE

LD1RSB

Load and broadcast signed byte to vector

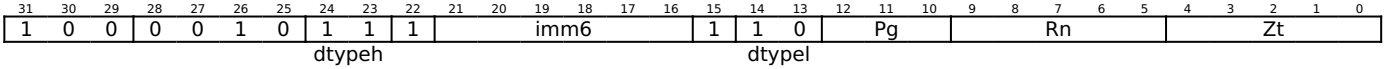
This instruction loads a single signed byte from a memory address generated by a 64-bit scalar base address plus an immediate offset that is in the range 0 to 63.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

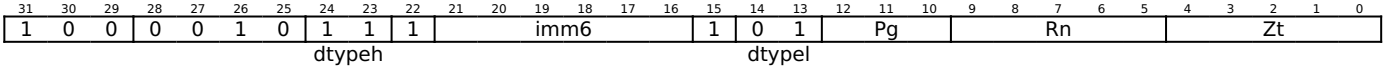
```
LD1RSB { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

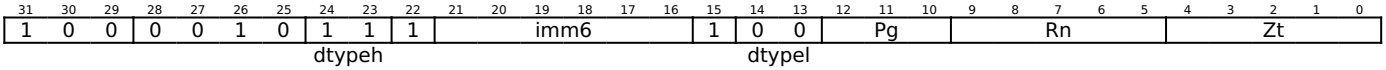
```
LD1RSB { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RSB { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, in the range 0 to 63, defaulting to 0, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();

LD1RSH

Load and broadcast signed halfword to vector

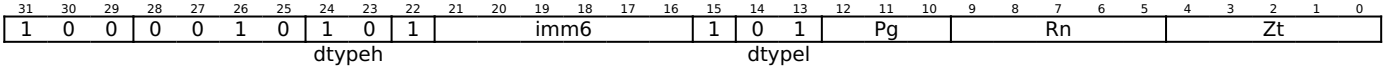
This instruction loads a single signed halfword from a memory address generated by a 64-bit scalar base address plus an immediate offset that is a multiple of 2 in the range 0 to 126.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

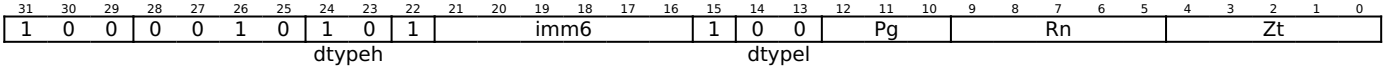
```
LD1RSH { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RSH { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 2 in the range 0 to 126, defaulting to 0, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var result : bits(VL);
var data : bits(msize);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);
if !AnyActiveElement{PL}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
    base = if n == 31 then SP{64}() else X{64}(n);
    let addr : bits(64) = AddressAdd(base, offset * mbytes, accdesc);
    data = Mem{msize}(addr, accdesc);
end;
for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = Extend{esize}(data, unsigned);
    else
        result[e*:esize] = Zeros{esize};
    end;
end;
Z{VL}(t) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LD1RSW

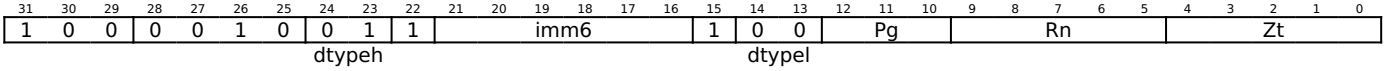
Load and broadcast signed word to vector

This instruction loads a single signed word from a memory address generated by a 64-bit scalar base address plus an immediate offset that is a multiple of 4 in the range 0 to 252.

The loaded data is broadcast into all Active elements of the destination vector, setting the Inactive elements to zero. If all elements are inactive, then the instruction will not perform a read from Device memory or cause a data abort.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1RSW { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm6);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 252, defaulting to 0, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var result : bits(VL);
var data : bits(msize);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);
if !AnyActiveElement{PL}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
    base = if n == 31 then SP{64}() else X{64}(n);
    let addr : bits(64) = AddressAdd(base, offset * mbytes, accdesc);
    data = Mem{msize}(addr, accdesc);
end;
for e = 0 to elements-1 do

LD1SB (scalar plus immediate)

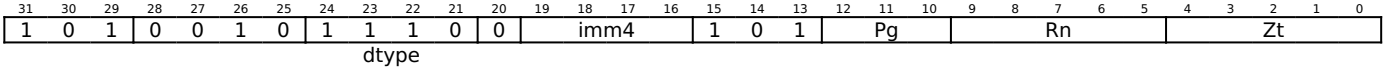
Contiguous load signed bytes to vector (immediate index)

This instruction performs a contiguous load of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE || FEAT_SME)



Encoding

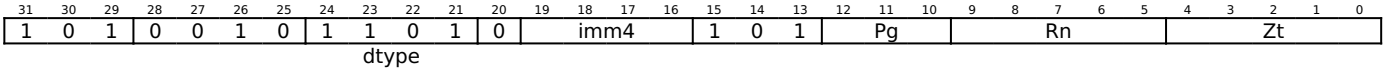
```
LD1SB { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

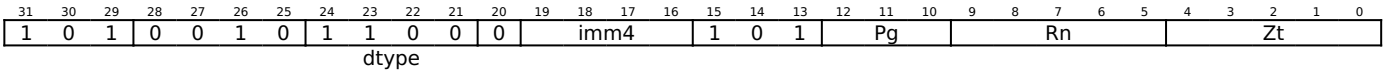
```
LD1SB { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1SB { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

LD1SB (scalar plus vector)

Gather load signed bytes to vector (vector index)

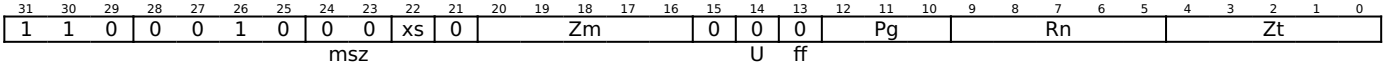
This instruction performs a gather load of signed bytes to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign-extended or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 32-bit unpacked unscaled offset , 32-bit unscaled offset and 64-bit unscaled offset

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

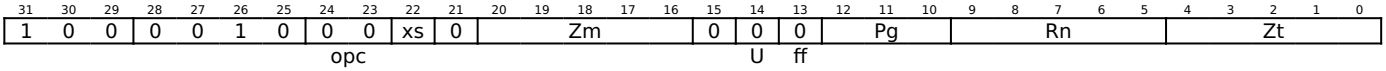
```
LD1SB { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

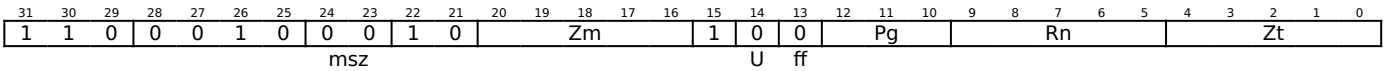
```
LD1SB { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1SB { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 64;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

LD1SB (vector plus immediate)

Gather load signed bytes to vector (immediate index)

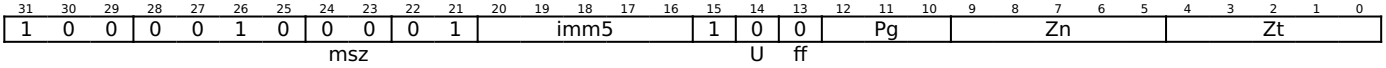
This instruction performs a gather load of signed bytes to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

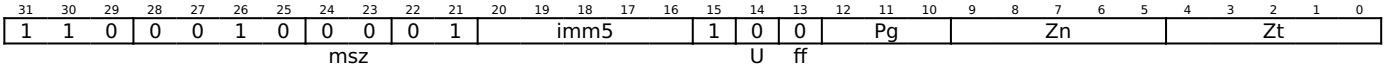
```
LD1SB { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
LD1SB { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var result : bits(VL);
var data : bits(msize);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = FALSE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);
if AnyActiveElement{PL}(mask, esize) then
    base = Z{VL}(n);
end;
for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let baddr : bits(64) = ZeroExtend{}(base[e*:esize]);
        let addr : bits(64) = AddressAdd(baddr, offset * mbytes, accdesc);
        data = Mem{msize}(addr, accdesc);
        result[e*:esize] = Extend{esize}(data, unsigned);
    else
        result[e*:esize] = Zeros{esize};
    end;
end;
Z{VL}(t) = result;
```

LD1SH (scalar plus vector)

Gather load signed halfwords to vector (vector index)

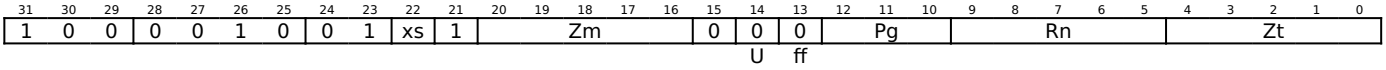
This instruction performs a gather load of signed halfwords to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

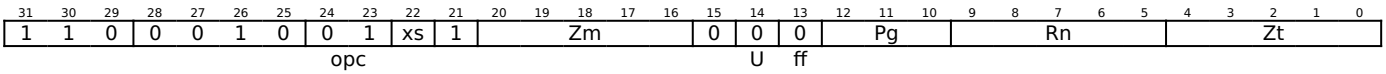
```
LD1SH { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

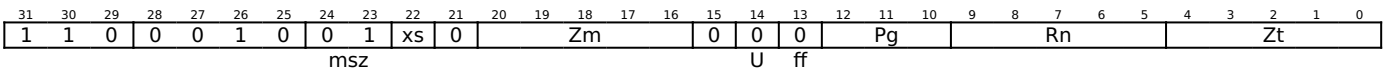
```
LD1SH { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

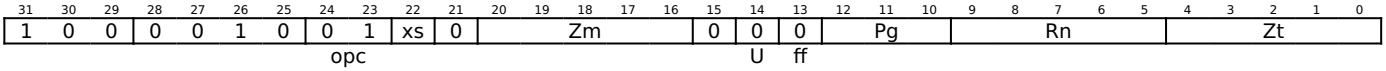
```
LD1SH { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1SH { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);

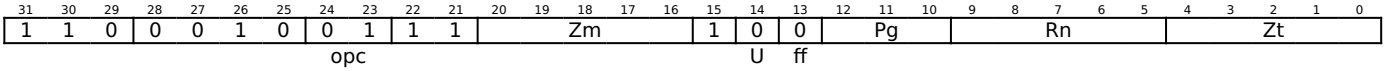
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

```
LD1SH { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);

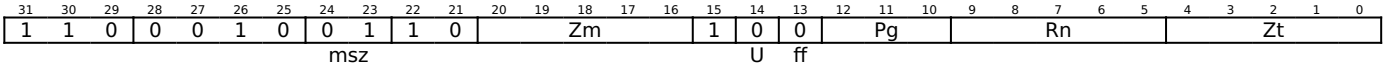
let msize : integer{} = 16;
let offs_size : integer{} = 64;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 1;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1SH { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 64;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

Operation

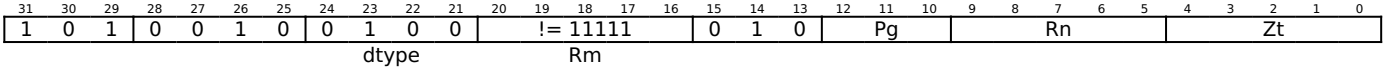
LD1SW (scalar plus scalar)

Contiguous load signed words to vector (scalar index)

This instruction performs a contiguous load of signed words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

LD1SW (scalar plus vector)

Gather load signed words to vector (vector index)

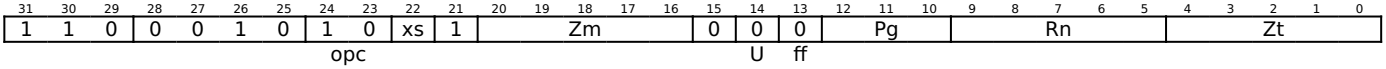
This instruction performs a gather load of signed words to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 4 classes: 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

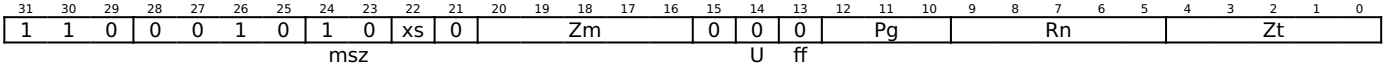
```
LD1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

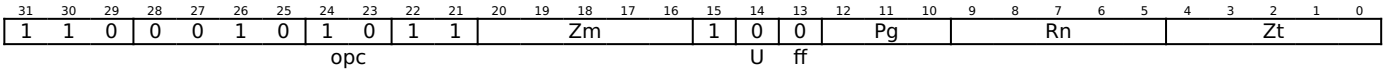
```
LD1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

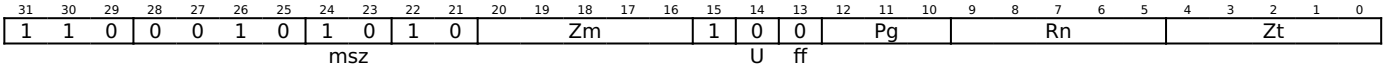
```
LD1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 64;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 2;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);

LD1W (scalar plus immediate, consecutive registers)

Contiguous load of words to multiple consecutive vectors (immediate index)

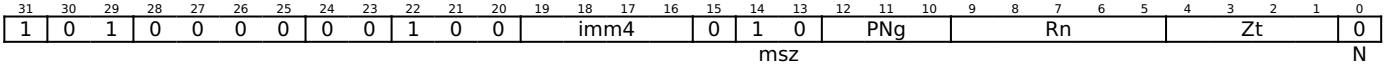
This instruction performs a contiguous load of unsigned words to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

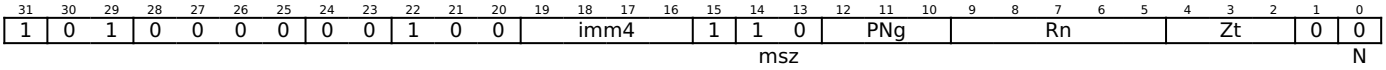
```
LD1W { <Zt1>.S-<Zt2>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1W { <Zt1>.S-<Zt4>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;

LD1W (scalar plus scalar, consecutive registers)

Contiguous load of words to multiple consecutive vectors (scalar index)

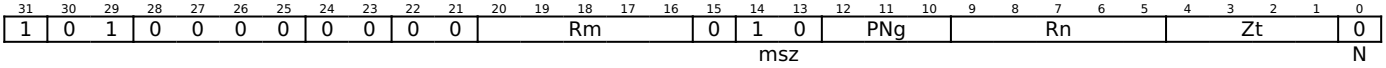
This instruction performs a contiguous load of unsigned words to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

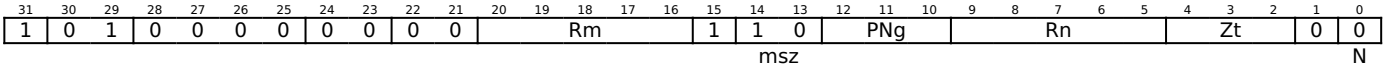
```
LD1W { <Zt1>.S-<Zt2>.S }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 32;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LD1W { <Zt1>.S-<Zt4>.S }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 32;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```

LD1W (scalar plus scalar, single register)

Contiguous load unsigned words to vector (scalar index)

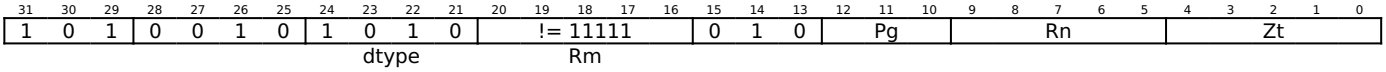
This instruction performs a contiguous load of unsigned words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

The 128-bit element variant is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 32-bit element , 64-bit element and 128-bit element

32-bit element

(FEAT_SVE || FEAT_SME)



Encoding

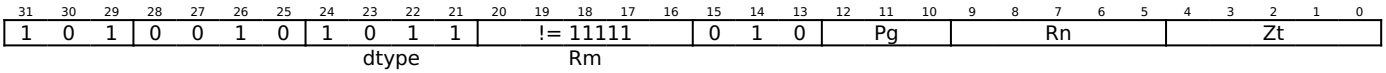
```
LD1W { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
```

64-bit element

(FEAT_SVE || FEAT_SME)



Encoding

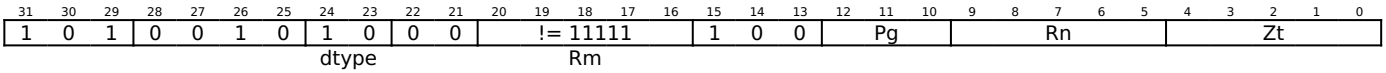
```
LD1W { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
```

128-bit element

(FEAT_SVE2p1)



Encoding

```
LD1W { <Zt>.Q }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 128;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

LD1W (scalar plus vector)

Gather load unsigned words to vector (vector index)

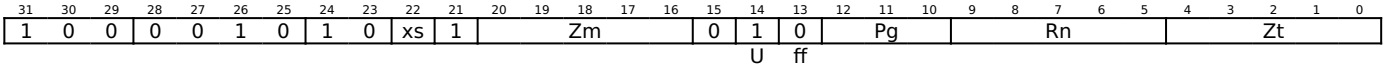
This instruction performs a gather load of unsigned words to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

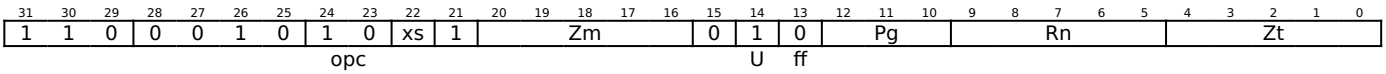
```
LD1W { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

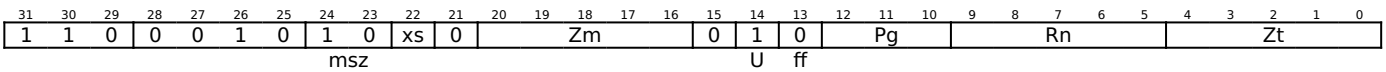
```
LD1W { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

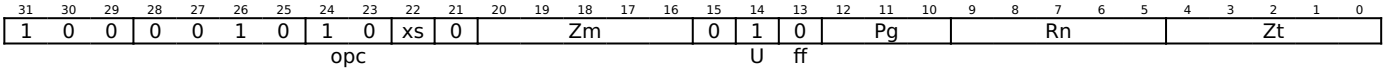
```
LD1W { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1W { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```

let msize : integer{} = 32;
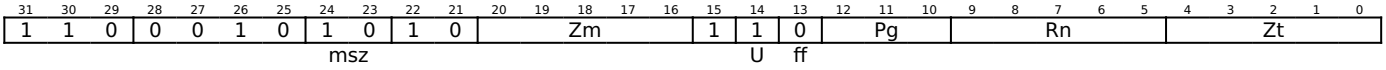
let offs_size : integer{} = 64;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 2;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
LD1W { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 64;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

LD1W (vector plus immediate)

Gather load unsigned words to vector (immediate index)

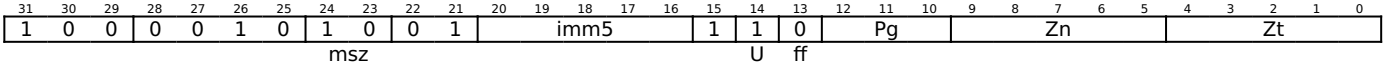
This instruction performs a gather load of unsigned words to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

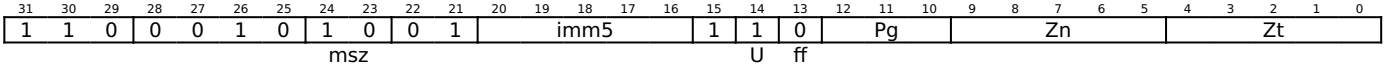
```
LD1W { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
LD1W { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);

LD2B (scalar plus immediate)

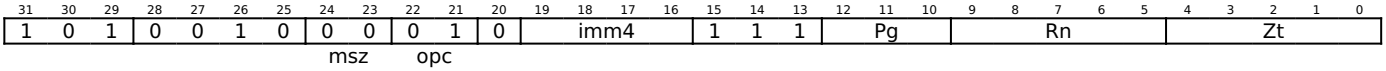
Contiguous load two-byte structures to two vectors (immediate index)

This instruction performs a contiguous load of two-byte structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD2B { <Zt1>.B, <Zt2>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
let nreg : integer{} = 2;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

LD2D (scalar plus immediate)

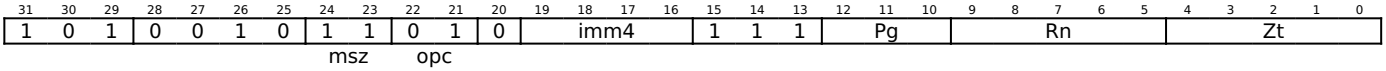
Contiguous load two-doubleword structures to two vectors (immediate index)

This instruction performs a contiguous load of two-doubleword structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive doublewords in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD2D { <Zt1>.D, <Zt2>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
let nreg : integer{} = 2;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var addr : bits(64);
let mbytes : integer{} = esize DIV 8;
var values : array [[nreg]] of bits(VL);
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;

let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);

LD2W (scalar plus scalar)

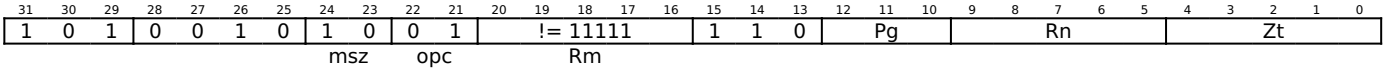
Contiguous load two-word structures to two vectors (scalar index)

This instruction performs a contiguous load of two-word structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by two. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive words in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD2W { <Zt1>.S, <Zt2>.S }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then

LD3H (scalar plus scalar)

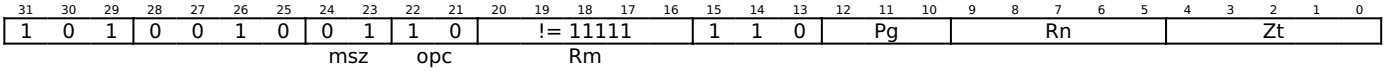
Contiguous load three-halfword structures to three vectors (scalar index)

This instruction performs a contiguous load of three-halfword structures, each to the same element number in three vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by three. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the three vector registers, or equivalently to the three consecutive halfwords in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the three destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD3H { <Zt1>.H, <Zt2>.H, <Zt3>.H }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let nreg : integer{} = 3;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Zt3>	Is the name of the third scalable vector register to be transferred, encoded as "Zt" plus 2 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);

LD4D (scalar plus immediate)

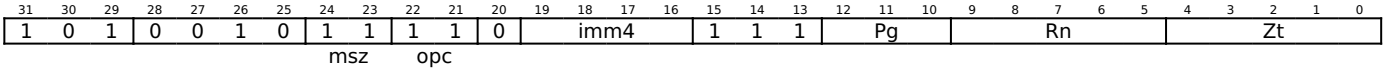
Contiguous load four-doubleword structures to four vectors (immediate index)

This instruction performs a contiguous load of four-doubleword structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive doublewords in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD4D { <Zt1>.D, <Zt2>.D, <Zt3>.D, <Zt4>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then

LD4W (scalar plus immediate)

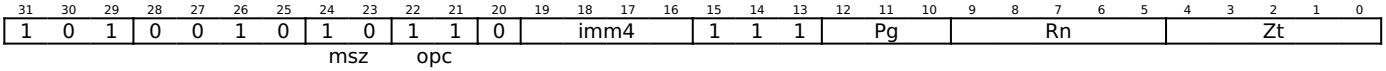
Contiguous load four-word structures to four vectors (immediate index)

This instruction performs a contiguous load of four-word structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and an immediate index that is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD4W { <Zt1>.S, <Zt2>.S, <Zt3>.S, <Zt4>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
let nreg : integer{} = 4;
```

Assembler Symbols

<Zt1>	Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
<Zt3>	Is the name of the third scalable vector register to be transferred, encoded as "Zt" plus 2 modulo 32.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" plus 3 modulo 32.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.

Operation

```
CheckSVEEnabled();

let VL : integer{} = CurrentVL();

LD4W (scalar plus scalar)

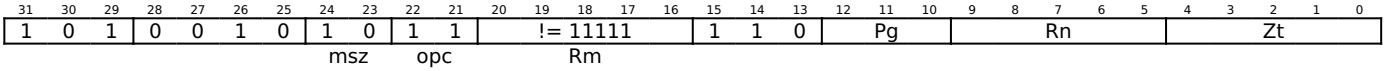
Contiguous load four-word structures to four vectors (scalar index)

This instruction performs a contiguous load of four-word structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by four. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory that make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LD4W { <Zt1>.S, <Zt2>.S, <Zt3>.S, <Zt4>.S }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

LDAPRO

Load-Acquire RCpc octaword

This instruction loads thirty-two contiguous bytes to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base, plus a scaled immediate offset. The base register must be aligned to 32 bytes if alignment is checked.

This instruction is unpredicated.

The instruction has memory ordering semantics as described in *Load-Acquire, Load-AcquirePC, and Store-Release*.

This instruction requires that the Effective SVE vector length is at least 256 bits.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE_LRCPC)

Encoding

```
LDAPRO <Zt>, [<Xn|SP>{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_LRCPC) then EndOfDecode(Decode_UNDEF); end;
if MaxImplementedVL() < 256 then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let imm : integer = UInt(imm8h::imm8l);
let acquirepc : boolean = TRUE;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional positive immediate byte offset, a multiple of 32 in the range 0 to 8160, defaulting to 0, encoded in the "imm8h:imm8l" fields.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
if VL < 256 then EndOfDecode(Decode_UNDEF); end;
var base : bits(64);
let offset : integer = imm * 32;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescLDAcqPC(tagchecked, acquirepc, t);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;

let addr : bits(64) = AddressAdd(base, offset, accdesc);

let data : bits(256) = Mem{256}(addr, accdesc);

Z{VL}(t) = ZeroExtend{VL}(data);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LDFF1D (scalar plus vector)

Gather load first-fault doublewords to vector (vector index)

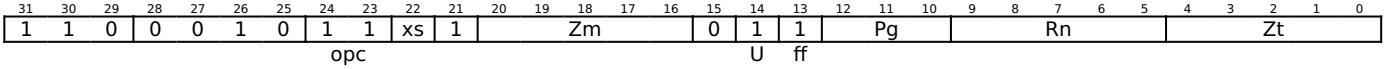
This instruction performs a gather load with first-faulting behavior of doublewords to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 4 classes: 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

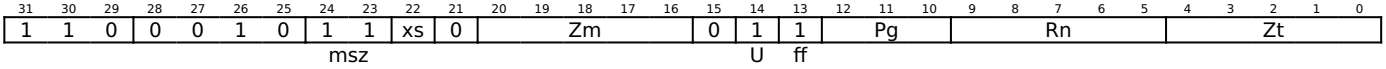
```
LDFF1D { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 3;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

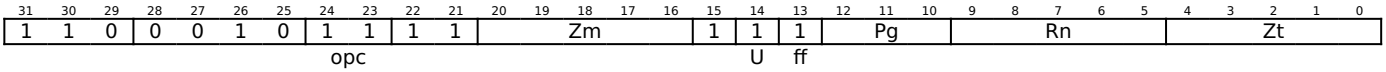
```
LDFF1D { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

```
LDFF1D { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);

LDFF1H (scalar plus vector)

Gather load first-fault unsigned halfwords to vector (vector index)

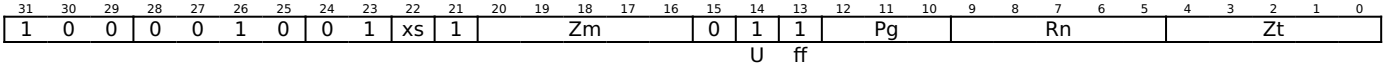
This instruction performs a gather load with first-faulting behavior of unsigned halfwords to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

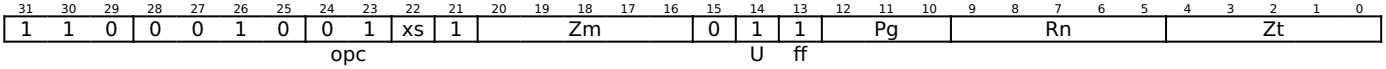
```
LDFF1H { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

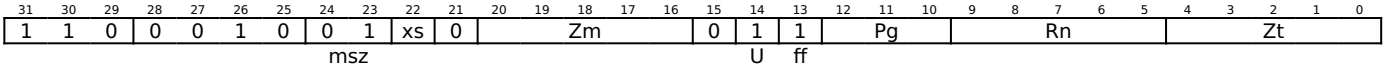
```
LDFF1H { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let unsigned : boolean = TRUE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

```
LDFF1H { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);

LDFF1H (vector plus immediate)

Gather load first-fault unsigned halfwords to vector (immediate index)

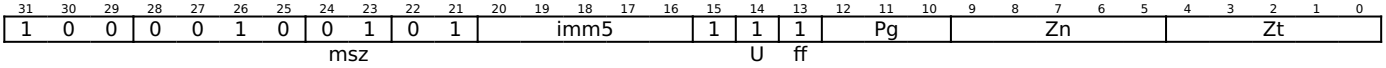
This instruction performs a gather load with first-faulting behavior of unsigned halfwords to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 2 in the range 0 to 62. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

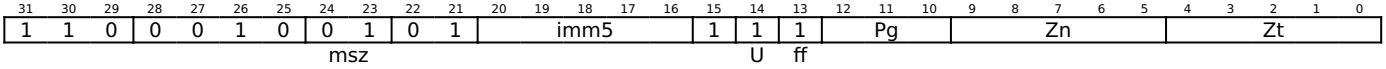
```
LDFF1H { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDFF1H { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 2 in the range 0 to 62, defaulting to 0, encoded in the "imm5" field.

LDFF1SB (scalar plus scalar)

Contiguous load first-fault signed bytes to vector (scalar index)

This instruction performs a contiguous load with first-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

LDFF1SB (vector plus immediate)

Gather load first-fault signed bytes to vector (immediate index)

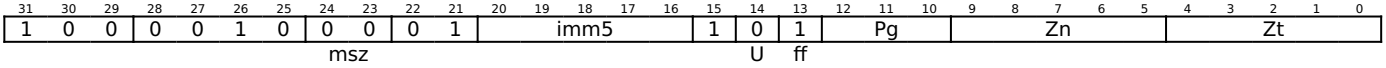
This instruction performs a gather load with first-faulting behavior of signed bytes to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

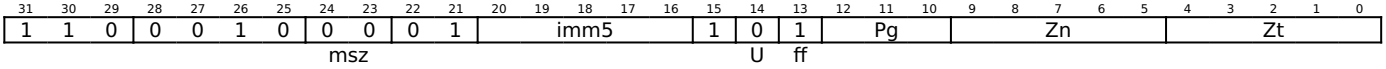
```
LDFF1SB { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDFF1SB { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.

Operation

LDFF1SW (scalar plus scalar)

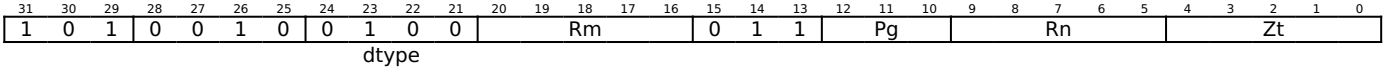
Contiguous load first-fault signed words to vector (scalar index)

This instruction performs a contiguous load with first-faulting behavior of signed words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, <Xm>, LSL #2}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;

LDFF1SW (scalar plus vector)

Gather load first-fault signed words to vector (vector index)

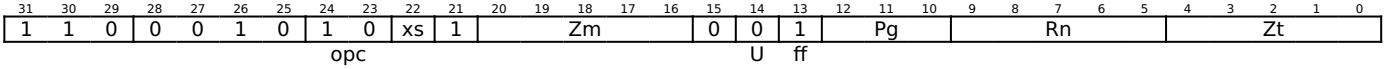
This instruction performs a gather load with first-faulting behavior of signed words to Active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 4 classes: 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

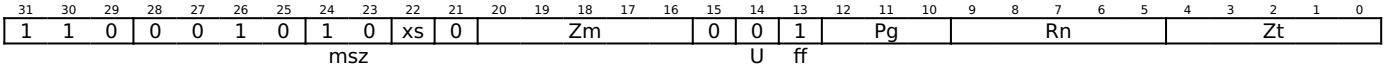
```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 2;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

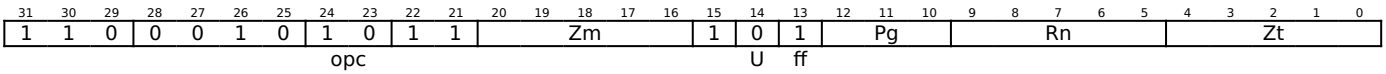
```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let offs_size : integer{} = 32;
let unsigned : boolean = FALSE;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;

LDFF1W (vector plus immediate)

Gather load first-fault unsigned words to vector (immediate index)

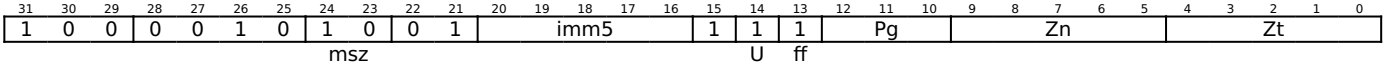
This instruction performs a gather load with first-faulting behavior of unsigned words to Active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

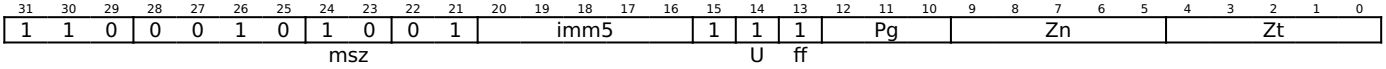
```
LDFF1W { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDFF1W { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();

LDNF1B

Contiguous load non-fault unsigned bytes to vector (immediate index)

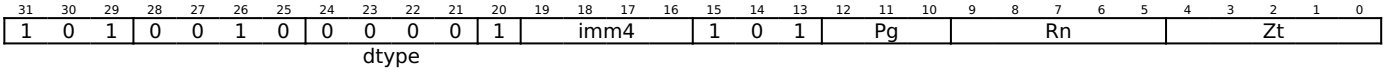
This instruction performs a contiguous load with non-faulting behavior of unsigned bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 4 classes: 8-bit element , 16-bit element , 32-bit element and 64-bit element

8-bit element

(FEAT_SVE)



Encoding

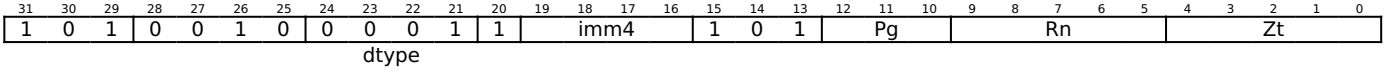
```
LDNF1B { <Zt>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 8;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

16-bit element

(FEAT_SVE)



Encoding

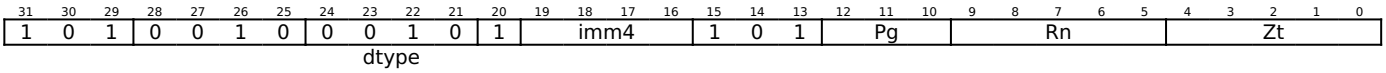
```
LDNF1B { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE)



Encoding

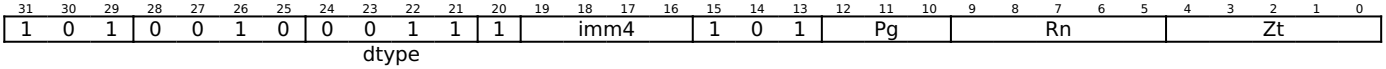
```
LDNF1B { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDNF1B { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;

LDNF1H

Contiguous load non-fault unsigned halfwords to vector (immediate index)

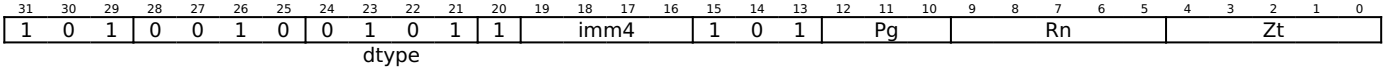
This instruction performs a contiguous load with non-faulting behavior of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE)



Encoding

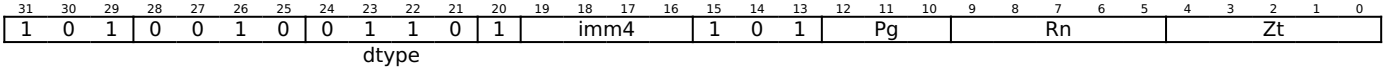
```
LDNF1H { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE)



Encoding

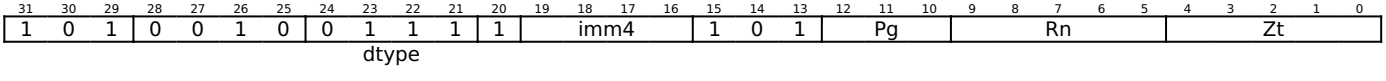
```
LDNF1H { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDNF1H { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let unsigned : boolean = TRUE;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

LDNF1SB

Contiguous load non-fault signed bytes to vector (immediate index)

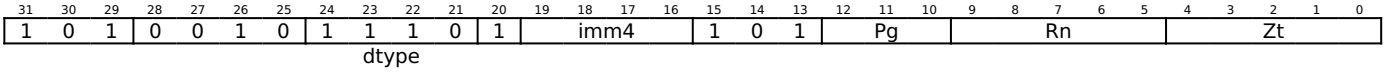
This instruction performs a contiguous load with non-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 16-bit element , 32-bit element and 64-bit element

16-bit element

(FEAT_SVE)



Encoding

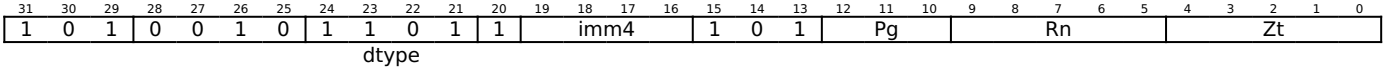
```
LDNF1SB { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 16;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

32-bit element

(FEAT_SVE)



Encoding

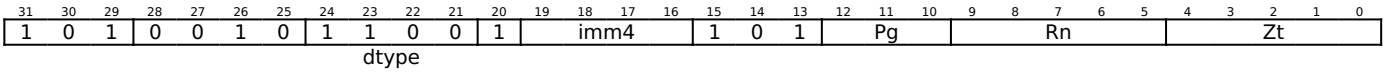
```
LDNF1SB { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

64-bit element

(FEAT_SVE)



Encoding

```
LDNF1SB { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = FALSE;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

LDNT1B (scalar plus immediate, consecutive registers)

Contiguous load non-temporal of bytes to multiple consecutive vectors (immediate index)

This instruction performs a contiguous non-temporal load of bytes to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

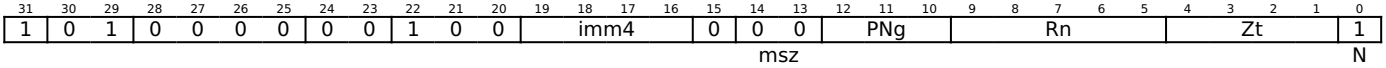
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

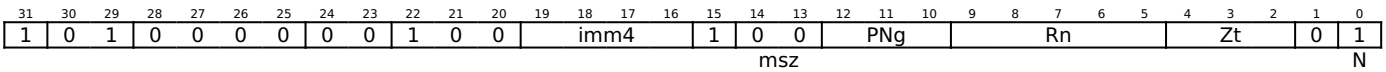
```
LDNT1B { <Zt1>.B-<Zt2>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1B { <Zt1>.B-<Zt4>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mbytes : integer{} = esize DIV 8;
var base : bits(64);
var addr : bits(64);
let pred : bits(PL) = P{}(g);
let mask : bits(PL * nreg) = CounterToPredicate{}(pred[15:0]);
var values : array [[4]] of bits(VL);
let contiguous : boolean = TRUE;
let nontemporal : boolean = TRUE;
let transfer : integer = t;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  tagchecked);

if !AnyActiveElement{PL*nreg}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
end;

base = if n == 31 then SP{64}() else X{64}(n);
addr = AddressAdd(base, offset * nreg * elements * mbytes, accdesc);

for r = 0 to nreg-1 do
    for e = 0 to elements-1 do
        if ActivePredicateElement{PL*nreg}(mask, r * elements + e, esize) then
            values[[r]][e*:esize] = Mem{esize}(addr, accdesc);
        else
            values[[r]][e*:esize] = Zeros{esize};
        end;
        addr = AddressIncrement(addr, mbytes, accdesc);
    end;
end;

for r = 0 to nreg-1 do
    Z{VL}(transfer+r) = values[[r]];
end;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

LDNT1B (scalar plus scalar, consecutive registers)

Contiguous load non-temporal of bytes to multiple consecutive vectors (scalar index)

This instruction performs a contiguous non-temporal load of bytes to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

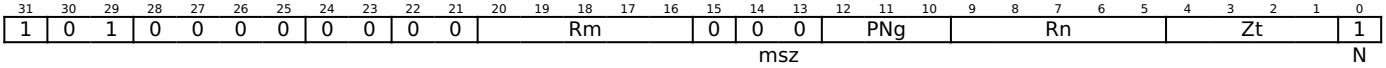
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1B { <Zt1>.B-<Zt2>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;

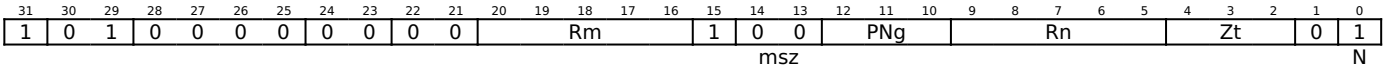
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;

let t : integer = UInt(Zt::'0');

let esize : integer{} = 8;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1B { <Zt1>.B-<Zt4>.B }, <PNg>/Z, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;

let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;

let t : integer = UInt(Zt::'00');

let esize : integer{} = 8;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

LDNT1B (vector plus scalar)

Gather load non-temporal unsigned bytes

This instruction performs a non-temporal gather load of unsigned bytes to Active elements of a vector register from memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

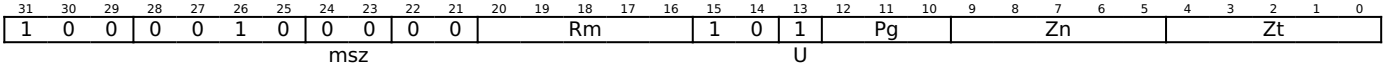
A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

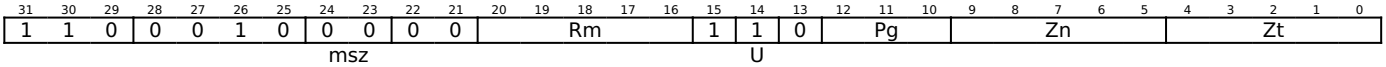
```
LDNT1B { <Zt>.S }, <Pg>/Z, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
```

64-bit unscaled offset

(FEAT_SVE2)



Encoding

```
LDNT1B { <Zt>.D }, <Pg>/Z, [<Zn>.D{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<Xm>	Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckNonStreamingSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);

LDNT1D (scalar plus scalar, single register)

Contiguous load non-temporal doublewords to vector (scalar index)

This instruction performs a contiguous non-temporal load of doublewords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 8 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

LDNT1H (scalar plus immediate, consecutive registers)

Contiguous load non-temporal of halfwords to multiple consecutive vectors (immediate index)

This instruction performs a contiguous non-temporal load of halfwords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

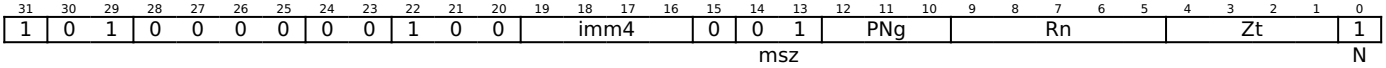
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

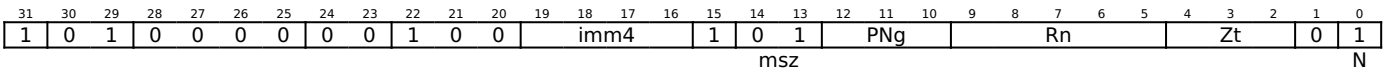
```
LDNT1H { <Zt1>.H-<Zt2>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1H { <Zt1>.H-<Zt4>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

LDNT1SB

Gather load non-temporal signed bytes

This instruction performs a non-temporal gather load of signed bytes to Active elements of a vector register from memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

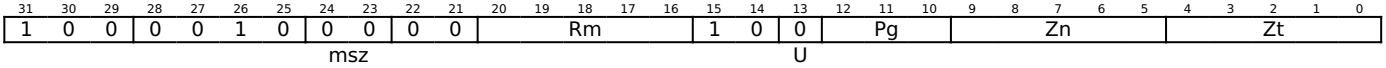
A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

```
LDNT1SB { <Zt>.S }, <Pg>/Z, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);

LDNT1W (scalar plus immediate, consecutive registers)

Contiguous load non-temporal of words to multiple consecutive vectors (immediate index)

This instruction performs a contiguous non-temporal load of words to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

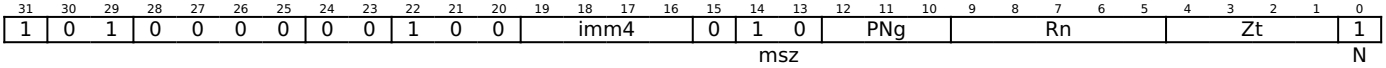
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

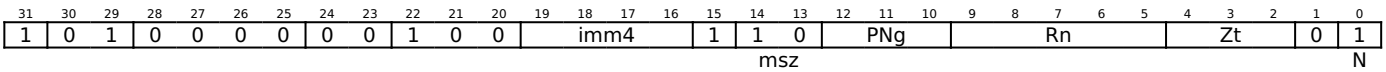
```
LDNT1W { <Zt1>.S-<Zt2>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1W { <Zt1>.S-<Zt4>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);

LDNT1W (scalar plus scalar, consecutive registers)

Contiguous load non-temporal of words to multiple consecutive vectors (scalar index)

This instruction performs a contiguous non-temporal load of words to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

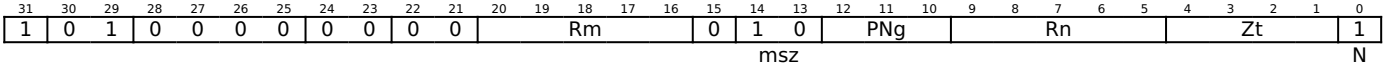
Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
LDNT1W { <Zt1>.S-<Zt2>.S }, <PNg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then

LDNT1W (scalar plus scalar, single register)

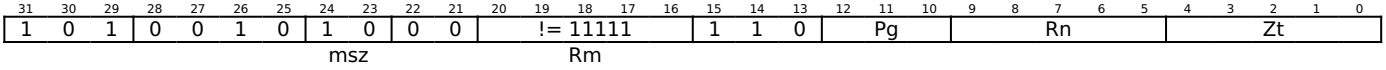
Contiguous load non-temporal words to vector (scalar index)

This instruction performs a contiguous non-temporal load of words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LDNT1W { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then

LDNT1W (vector plus scalar)

Gather load non-temporal unsigned words

This instruction performs a non-temporal gather load of unsigned words to Active elements of a vector register from memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

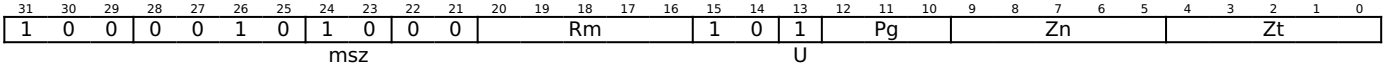
A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

(FEAT_SVE2)



Encoding

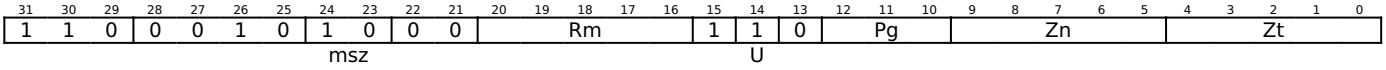
```
LDNT1W { <Zt>.S }, <Pg>/Z, [<Zn>.S{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
```

64-bit unscaled offset

(FEAT_SVE2)



Encoding

```
LDNT1W { <Zt>.D }, <Pg>/Z, [<Zn>.D{, <Xm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 32;
let unsigned : boolean = TRUE;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<Xm>	Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckNonStreamingSVEEnabled();

let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var offset : bits(64);
var result : bits(VL);
var data : bits(msize);
let contiguous : boolean = FALSE;
let nontemporal : boolean = TRUE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);

if AnyActiveElement{PL}(mask, esize) then

LDR (predicate)

Load predicate register

This instruction loads a predicate register from a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 that is multiplied by the current predicate register size in bytes. This instruction is unpredicated.

The load is performed as contiguous byte accesses, each containing 8 consecutive predicate bits in ascending element order, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then a general-purpose base register must be aligned to 2 bytes.

For programmer convenience, an assembler must also accept a predicate-as-counter register name for the destination predicate register.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
LDR <Pt>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let t : integer = UInt(Pt);
let n : integer = UInt(Rn);
let imm : integer = SInt(imm9h::imm9l);
```

Assembler Symbols

<Pt>	Is the name of the destination scalable predicate register, encoded in the "Pt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -256 to 255, defaulting to 0, encoded in the "imm9h:imm9l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = PL DIV 8;
var base : bits(64);
let offset : integer = imm * elements;
var result : bits(PL);
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = FALSE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous,
                                                  predicated, tagchecked);

if n == 31 then
    CheckSPAlignment();
    base = SP{64}();
else
    base = X{64}(n);
end;

var addr : bits(64) = AddressAdd(base, offset, accdesc);

let aligned : boolean = IsAlignedSize(base, 2);

if !aligned && AlignmentEnforced() then
    let fault : FaultRecord = AlignmentFault(accdesc, addr);
    AArch64_Abort(fault);
end;

for e = 0 to elements-1 do
    result[e*:8] = AArch64_MemSingle{8}(addr, accdesc, aligned);
    addr = AddressIncrement(addr, 1, accdesc);
end;

P{PL}(t) = result;
```

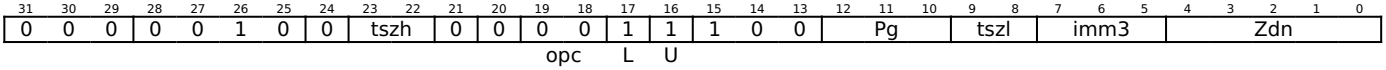
LSL (immediate, predicated)

Logical shift left by immediate (predicated)

This instruction shifts left by immediate each Active element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LSL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let shift : integer = UInt(tsize::imm3) - esize;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let PL : integer{} = VL DIV 8;
let operand1 : bits(VL) = Z{}(dn);
let mask : bits(PL) = P{}(g);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = LSL(element1, shift);
    else
        result[e*:esize] = operand1[e*:esize];
    end;

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	RESERVED

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(64) = operand2[((e * esize) DIVRM 64)*:64];
    let shift : integer = Min(UInt(element2), esize);
    result[e*:esize] = LSL(element1, shift);
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

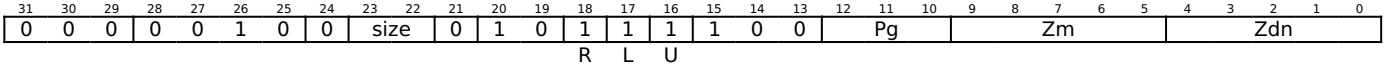
LSLR

Reversed logical shift left by vector (predicated)

This instruction reverse shifts left Active elements of the second source vector by the corresponding elements of the first source vector, and destructively places the results in the corresponding elements of the first source vector. The shift amount operand is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LSLR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : bits(esize) = operand1[e*:esize];
        let element2 : bits(esize) = operand2[e*:esize];
        let shift : integer = Min(UInt(element1), esize);
        result[e*:esize] = LSL(element2, shift);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

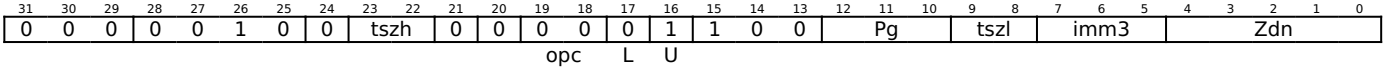
LSR (immediate, predicated)

Logical shift right by immediate (predicated)

This instruction shifts right by immediate, inserting zeros, each Active element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
LSR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

LUTI2 (8-bit and 16-bit)

Lookup table read with 2-bit indices (8-bit and 16-bit)

This instruction copies indexed 8-bit or 16-bit elements from the low 128 bits of the table vector to the destination vector using packed 2-bit indices from a segment of the source vector. A segment corresponds to a portion of the source vector that is consumed in order to fill the destination vector. The segment is selected by the vector segment index. This instruction is unpredicated.

It has encodings from 2 classes: Byte and Halfword

Byte

((FEAT_SVE2 || FEAT_SME2) && FEAT_LUT)

Encoding

```
LUTI2 <Zd>.B, { <Zn>.B }, <Zm>[<index>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_LUT)) then EndOfDecode(Decode_UNDEF);
end;
let isize : integer{} = 2;
let esize : integer{} = 8;
let m : integer = UInt(Zm);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let part : integer = UInt(i2);
```

Halfword

((FEAT_SVE2 || FEAT_SME2) && FEAT_LUT)

Encoding

```
LUTI2 <Zd>.H, { <Zn>.H }, <Zm>[<index>]
```

Decode for this encoding

```
if ((!IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME2)) ||
     !IsFeatureImplemented(FEAT_LUT)) then EndOfDecode(Decode_UNDEF);
end;
let isize : integer{} = 2;
let esize : integer{} = 16;
let m : integer = UInt(Zm);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let part : integer = UInt(i3h::i3l);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the table vector register, encoded in the "Zn" field.
<Zm>	Is the name of the source scalable vector register, encoded in the "Zm" field.
<index>	For the "Byte" variant: is the vector segment index, in the range 0 to 3, encoded in the "i2" field. For the "Halfword" variant: is the vector segment index, in the range 0 to 7, encoded in the "i3h:i3l" fields.

Operation

```
if IsFeatureImplemented(FEAT_SME2) then CheckSVEEnabled(); else CheckNonStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let ibase : integer = elements * part;

LUTI6 (16-bit)

Lookup table read with 6-bit indices (16-bit)

This instruction copies indexed 16-bit elements from the low 512 bits of the two table vectors to the destination vector using packed 6-bit indices from a segment in the bottom three quarters of the source vector register.

This instruction is unpredicated.

This instruction requires that the Effective SVE vector length is at least 512 bits.

SVE2

(FEAT_SVE2p3 || FEAT_SME2p3)

Encoding

```
LUTI6 <Zd>.H, { <Zn1>.H, <Zn2>.H }, <Zm>[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
if MaxImplementedAnyVL() < 512 then EndOfDecode(Decode_UNDEF); end;

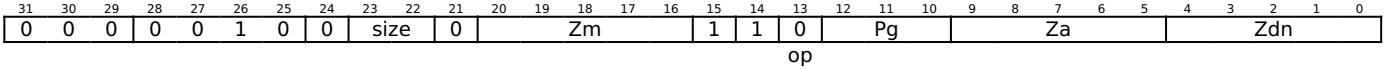
MAD

Multiply-add to multiplicand (predicated)

This instruction multiplies the Active elements of the first source vector by the corresponding elements of the second source vector, and adds the result to elements of the third (addend) vector. The results are destructively placed in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MAD <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let a : integer = UInt(Za);
let sub_op : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Za> Is the name of the third source scalable vector register, encoded in the "Za" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let operand3 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(a) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : integer = UInt(operand1[e*:esize]);
        let element2 : integer = UInt(operand2[e*:esize]);
        let product : integer = element1 * element2;
        if sub_op then
            result[e*:esize] = operand3[e*:esize] - product;
        else
            result[e*:esize] = operand3[e*:esize] + product;
        end;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

MATCH

Detect any matching elements within quadwords, setting the condition flags

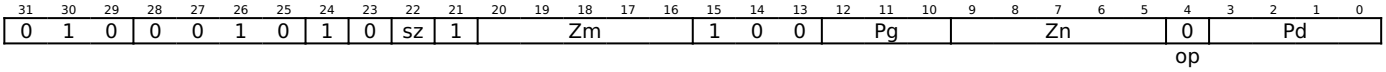
This instruction compares each Active 8-bit or 16-bit element in the first source vector with all of the elements in the corresponding 128-bit segment of the second source vector. For each element in the first source vector, if any matching element is found in the corresponding segment of the second source vector, the corresponding element of the destination predicate is set to true, otherwise it is set to false. Inactive elements in the destination predicate register are set to zero.

This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2)



Encoding

```
MATCH <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

MLA (indexed)

Multiply-add by indexed element

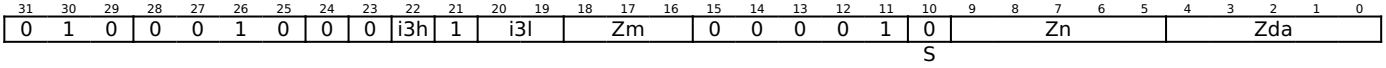
This instruction multiplies all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

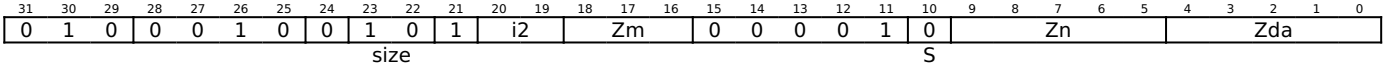
```
MLA <Zda>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

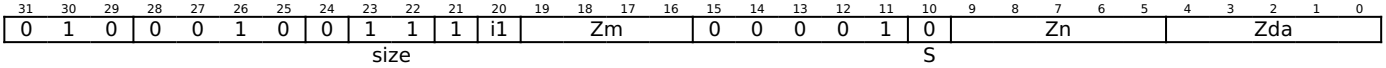
```
MLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
MLA <Zda>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[s*:esize]);
    let product : bits(esize) = (element1 * element2)[esize-1:0];
    result[e*:esize] = result[e*:esize] + product;
end;

Z{VL}(da) = result;
```

Operational information

let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:64]);
    let element2 : integer = SInt(operand2[e*:64]);
    let product : integer = element1 * element2;
    let overflow : boolean = (product != SInt(product[63:0]));
    let addend : bits(64) = operand3[e*:64];
    result[e*:64] = PointerMultiplyAddCheck(addend + product, addend, overflow);
end;

Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

MLS (indexed)

Multiply-subtract by indexed element

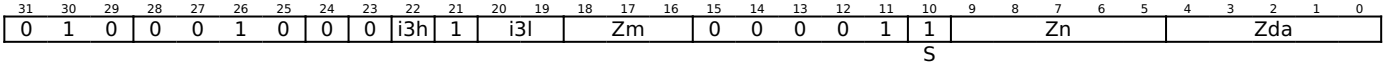
This instruction multiplies all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

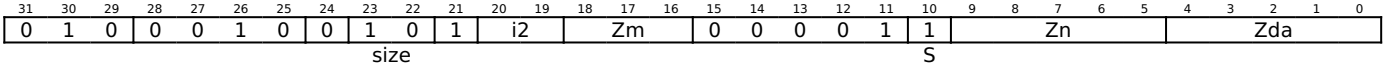
```
MLS <Zda>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

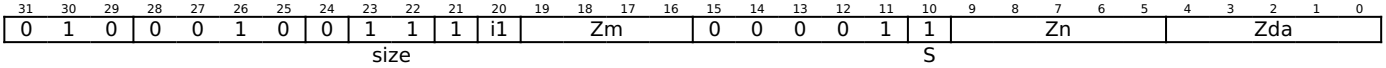
```
MLS <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
MLS <Zda>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[s*:esize]);
    let product : bits(esize) = (element1 * element2)[esize-1:0];
    result[e*:esize] = result[e*:esize] - product;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

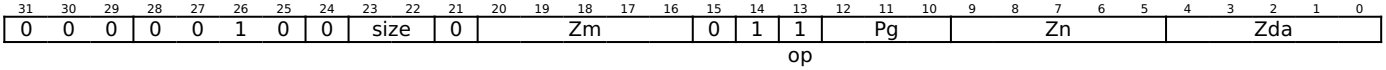
MLS (vectors)

Multiply-subtract (predicated)

This instruction multiplies the Active elements of the first source vector by the corresponding elements of the second source vector, and subtracts the result from elements of the third source (addend) vector. The results are destructively placed in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MLS <Zda>.<T>, <Pg>/M, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sub_op : boolean = TRUE;
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : integer = UInt(operand1[e*:esize]);
        let element2 : integer = UInt(operand2[e*:esize]);
        let product : integer = element1 * element2;
        if sub_op then
            result[e*:esize] = operand3[e*:esize] - product;
        else
            result[e*:esize] = operand3[e*:esize] + product;
        end;
    else
        result[e*:esize] = operand3[e*:esize];
    end;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

MOV

Move logical bitmask immediate to vector (unpredicated)

This instruction unconditionally broadcasts the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits.

This is an alias of DUPM. This means:

- The encodings in this description are named to match the encodings of DUPM.
- The description of DUPM gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
MOV <Zd>.<T>, #<const>
```

is equivalent to

```
DUPM <Zd>.<T>, #<const>
```

and is the preferred disassembly when `SVEMoveMaskPreferred(imm13)`.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

The description of DUPM gives the operational pseudocode for this instruction.

MOV

Move predicate (unpredicated)

This instruction reads all elements from the source predicate and places those elements in the destination predicate. This instruction is unpredicated. This instruction does not set the condition flags.

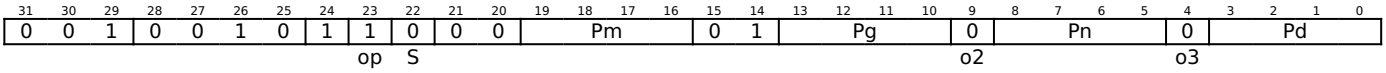
For programmer convenience, an assembler must also accept predicate-as-counter register names for the source and destination predicate registers.

This is an alias of ORR (predicates). This means:

- The encodings in this description are named to match the encodings of ORR (predicates).
- The description of ORR (predicates) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Pd>.B, <Pn>.B
```

is equivalent to

```
ORR <Pd>.B, <Pn>/Z, <Pn>.B, <Pn>.B
```

and is the preferred disassembly when `S == '0' && Pn == Pm && Pm == Pg`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of ORR (predicates) gives the operational pseudocode for this instruction.

Operational Information

The description of ORR (predicates) gives the operational information for this instruction.

MOV (immediate, merging)

Move signed integer immediate to vector elements (merging)

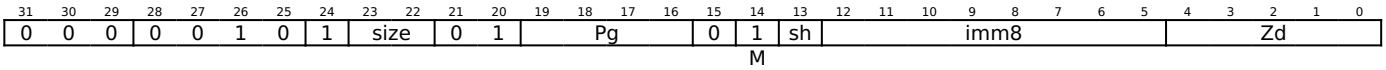
This instruction moves a signed integer immediate to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.
The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of CPY (immediate, merging). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, merging).
- The description of CPY (immediate, merging) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}
```

is equivalent to

```
CPY <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

Operational Information

The description of CPY (immediate, merging) gives the operational information for this instruction.

MOV (immediate, unpredicated)

Move signed immediate to vector elements (unpredicated)

This instruction unconditionally broadcasts the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

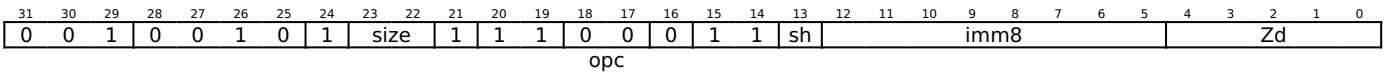
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of DUP (immediate). This means:

- The encodings in this description are named to match the encodings of DUP (immediate).
- The description of DUP (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Zd>.<T>, #<imm>{, <shift>}
```

is equivalent to

```
DUP <Zd>.<T>, #<imm>{, <shift>}
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

The description of DUP (immediate) gives the operational pseudocode for this instruction.

MOV (immediate, zeroing)

Move signed integer immediate to vector elements (zeroing)

This instruction moves a signed integer immediate to each Active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

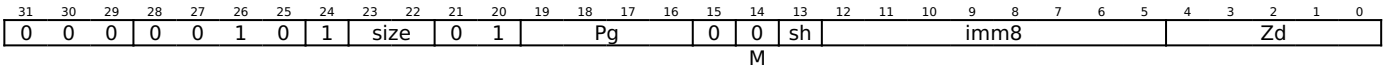
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of CPY (immediate, zeroing). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, zeroing).
- The description of CPY (immediate, zeroing) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Zd>.<T>, <Pg>/Z, #<imm>{, <shift>}
```

is equivalent to

```
CPY <Zd>.<T>, <Pg>/Z, #<imm>{, <shift>}
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

The description of CPY (immediate, zeroing) gives the operational pseudocode for this instruction.

MOV (predicate, merging)

Move predicates (merging)

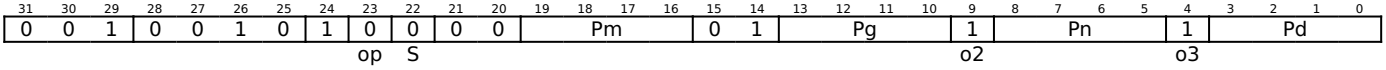
This instruction reads Active elements from the source predicate and places those elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register remain unmodified. This instruction does not set the condition flags.

This is an alias of SEL (predicates). This means:

- The encodings in this description are named to match the encodings of SEL (predicates).
- The description of SEL (predicates) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Pd>.B, <Pg>/M, <Pn>.B
```

is equivalent to

```
SEL <Pd>.B, <Pg>, <Pn>.B, <Pd>.B
```

and is the preferred disassembly when `Pd == Pm`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of SEL (predicates) gives the operational pseudocode for this instruction.

Operational Information

The description of SEL (predicates) gives the operational information for this instruction.

MOV (scalar, predicated)

Move general-purpose register to vector elements (predicated)

This instruction moves the general-purpose scalar source register to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of CPY (scalar). This means:

- The encodings in this description are named to match the encodings of CPY (scalar).
- The description of CPY (scalar) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding for the 32-bit variant

Applies when `(size != 11)`

```
MOV <Zd>.<T>, <Pg>/M, <Wn|WSP>
```

is equivalent to

```
CPY <Zd>.<T>, <Pg>/M, <Wn|WSP>
```

and is always the preferred disassembly.

Encoding for the 64-bit variant

Applies when `(size == 11)`

```
MOV <Zd>.D, <Pg>/M, <Xn|SP>
```

is equivalent to

```
CPY <Zd>.D, <Pg>/M, <Xn|SP>
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

Operation

The description of CPY (scalar) gives the operational pseudocode for this instruction.

Operational Information

The description of CPY (scalar) gives the operational information for this instruction.

MOV (SIMD&FP scalar, predicated)

Move SIMD&FP scalar register to vector elements (predicated)

This instruction moves the SIMD & floating-point scalar source register to each Active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of CPY (SIMD&FP scalar). This means:

- The encodings in this description are named to match the encodings of CPY (SIMD&FP scalar).
- The description of CPY (SIMD&FP scalar) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
MOV <Zd>.<T>, <Pg>/M, <V><n>
```

is equivalent to

```
CPY <Zd>.<T>, <Pg>/M, <V><n>
```

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

Operation

The description of CPY (SIMD&FP scalar) gives the operational pseudocode for this instruction.

Operational Information

The description of CPY (SIMD&FP scalar) gives the operational information for this instruction.

MOV (SIMD&FP scalar, unpredicated)

Move indexed element or SIMD&FP scalar to vector (unpredicated)

This instruction unconditionally broadcasts the SIMD&FP scalar into each element of the destination vector. This instruction is unpredicated.

This is an alias of DUP (indexed). This means:

- The encodings in this description are named to match the encodings of DUP (indexed).
- The description of DUP (indexed) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
MOV <Zd>.<T>, <V><n>
```

is equivalent to

```
DUP <Zd>.<T>, <Zn>.<T>[0]
```

and is the preferred disassembly when `BitCount(imm2 :: tsz) == 1`.

Encoding

```
MOV <Zd>.<T>, <Zn>.<T>[<imm>]
```

is equivalent to

```
DUP <Zd>.<T>, <Zn>.<T>[<imm>]
```

and is the preferred disassembly when `BitCount(imm2 :: tsz) > 1`.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsz”:

tsz	<T>
00000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D
10000	Q

<V> Is a width specifier, encoded in “tsz”:

tsz	<V>
00000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D
10000	Q

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the "Zn" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 512 bits, encoded in "imm2:tsz".

Operation

The description of DUP (indexed) gives the operational pseudocode for this instruction.

Operational Information

The description of DUP (indexed) gives the operational information for this instruction.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MOV (vector, predicated)

Move vector elements (predicated)

This instruction moves elements from the source vector to the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of SEL (vectors). This means:

- The encodings in this description are named to match the encodings of SEL (vectors).
- The description of SEL (vectors) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
MOV <Zd>.<T>, <Pv>/M, <Zn>.<T>
```

is equivalent to

```
SEL <Zd>.<T>, <Pv>, <Zn>.<T>, <Zd>.<T>
```

and is the preferred disassembly when `Zd == Zm`.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register, encoded in the "Pv" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

The description of SEL (vectors) gives the operational pseudocode for this instruction.

Operational Information

The description of SEL (vectors) gives the operational information for this instruction.

MOV (vector, unpredicated)

Move vector register (unpredicated)

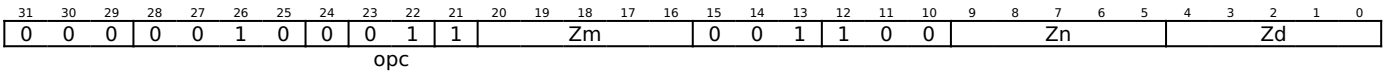
This instruction copies the contents of the source vector register to the destination vector register. This instruction is unpredicated.

This is an alias of ORR (vectors, unpredicated). This means:

- The encodings in this description are named to match the encodings of ORR (vectors, unpredicated).
- The description of ORR (vectors, unpredicated) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOV <Zd>.D, <Zn>.D
```

is equivalent to

```
ORR <Zd>.D, <Zn>.D, <Zn>.D
```

and is the preferred disassembly when `Zn == Zm`.

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

The description of ORR (vectors, unpredicated) gives the operational pseudocode for this instruction.

Operational Information

The description of ORR (vectors, unpredicated) gives the operational information for this instruction.

MOVPRFX (predicated)

Move prefix (predicated)

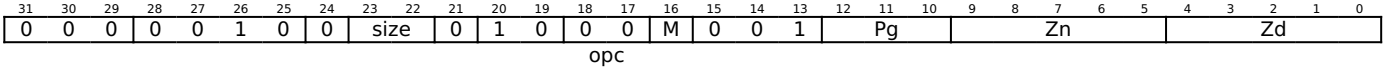
This instruction is a hint to hardware that the instruction may be combined with the destructive instruction that follows it in program order to create a single constructive operation. This instruction is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically.

Unless the combination of a constructive operation with merging predication is specifically required, it is strongly recommended that for performance reasons software should prefer to use the zeroing form of predicated MOVPRFX or the unpredicated MOVPRFX instruction.

Although the operation of the instruction is defined as a simple predicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVPRFX instructions. The prefixed instruction must specify the same predicate register, and have the same maximum element size (ignoring a fixed 64-bit "wide vector" operand), and the same destination vector as the MOVPRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MOVPRFX <Zd>.<T>, <Pg>/<ZM>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = (M == '1');
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<ZM> Is the predication qualifier, encoded in “M”:

M	<ZM>
0	Z
1	M

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let dest : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand1[e*:esize];
        result[e*:esize] = element;
    else
        result[e*:esize] = dest[e*:esize];
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

MOVS (predicated)

Move predicates (zeroing), setting the condition flags

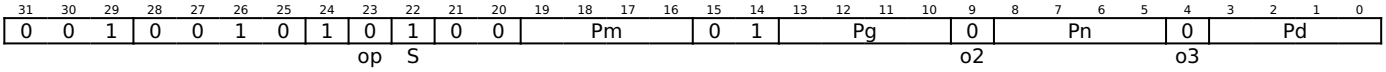
This instruction reads Active elements from the source predicate and places those elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This is an alias of ANDS. This means:

- The encodings in this description are named to match the encodings of ANDS.
- The description of ANDS gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
MOVS <Pd>.B, <Pg>/Z, <Pn>.B
```

is equivalent to

```
ANDS <Pd>.B, <Pg>/Z, <Pn>.B, <Pn>.B
```

and is the preferred disassembly when `S == '1' && Pn == Pm`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of ANDS gives the operational pseudocode for this instruction.

Operational Information

The description of ANDS gives the operational information for this instruction.

MOVS (unpredicated)

Move predicate (unpredicated), setting the condition flags

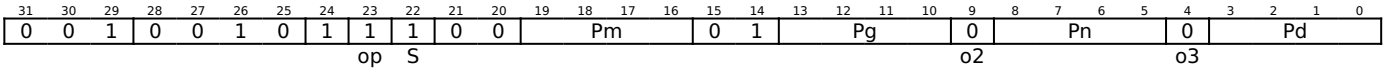
This instruction reads all elements from the source predicate and places those elements in the destination predicate. This instruction is unpredicated. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This is an alias of ORRS. This means:

- The encodings in this description are named to match the encodings of ORRS.
- The description of ORRS gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
MOVS <Pd>.B, <Pn>.B
```

is equivalent to

```
ORRS <Pd>.B, <Pn>/Z, <Pn>.B, <Pn>.B
```

and is the preferred disassembly when `S == '1' && Pn == Pm && Pm == Pg`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of ORRS gives the operational pseudocode for this instruction.

Operational Information

The description of ORRS gives the operational information for this instruction.

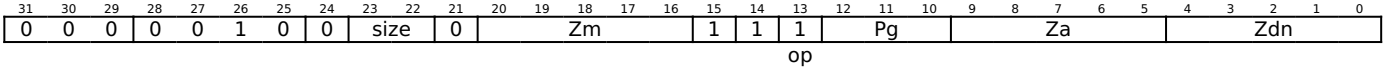
MSB

Multiply-subtract to multiplicand

This instruction multiplies the Active elements of the first source vector by the corresponding elements of the second source vector, and subtracts the result from elements of the third (addend) vector. The results are destructively placed in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MSB <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Za>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
let a : integer = UInt(Za);
let sub_op : boolean = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Za> Is the name of the third source scalable vector register, encoded in the "Za" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
let operand3 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(a) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element1 : integer = UInt(operand1[e*:esize]);
        let element2 : integer = UInt(operand2[e*:esize]);
        let product : integer = element1 * element2;
        if sub_op then
            result[e*:esize] = operand3[e*:esize] - product;
        else
            result[e*:esize] = operand3[e*:esize] + product;
        end;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

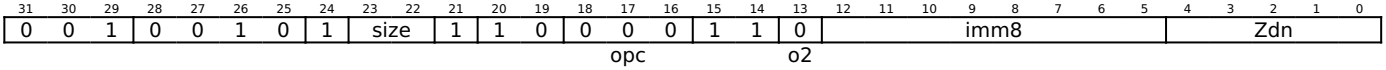
MUL (immediate)

Multiply by immediate (unpredicated)

This instruction multiplies each element of the source vector by an immediate, and destructively places the results in the corresponding elements of the source vector. The immediate is a signed 8-bit value in the range -128 to +127, inclusive. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
MUL <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let imm : integer = SInt(imm8);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the signed immediate operand, in the range -128 to 127, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    result[e*:esize] = (element1 * imm)[esize-1:0];

end;
Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

MUL (indexed)

Multiply by indexed element

This instruction multiplies all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)

Encoding

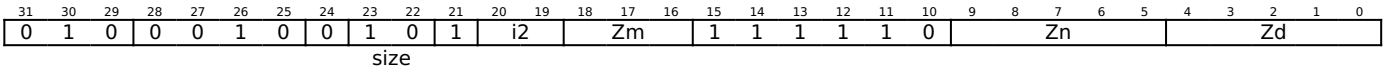
```
MUL <Zd>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

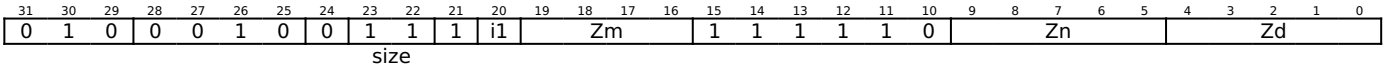
```
MUL <Zd>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
MUL <Zd>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[s*:esize]);
    let res : integer = element1 * element2;
    result[e*:esize] = res[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

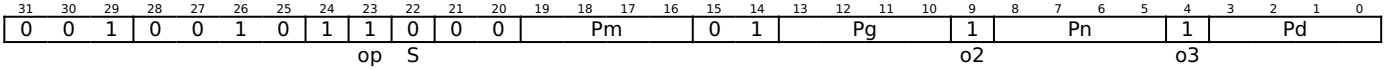
NAND

Bitwise NAND predicates

This instruction performs a bitwise NAND between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NAND <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(NOT(element1 AND element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

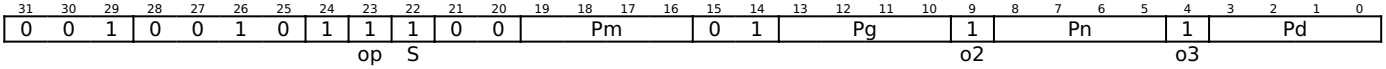
NANDS

Bitwise NAND predicates, setting the condition flags

This instruction performs a bitwise NAND between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NANDS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(NOT(element1 AND element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

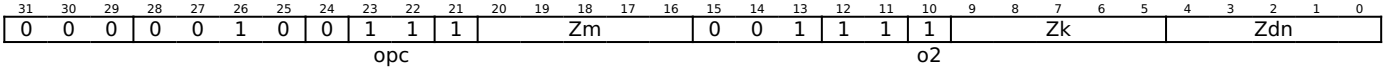
NBSL

Bitwise inverted select

This instruction selects bits from the first source vector where the corresponding bit in the third source vector is '1', and from the second source vector where the corresponding bit in the third source vector is '0'. The inverted result is destructively placed in the destination and first source vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
NBSL <Zdn>.D, <Zdn>.D, <Zm>.D, <Zk>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let m : integer = UInt(Zm);
let k : integer = UInt(Zk);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn>	Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk>	Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(k);

Z{VL}(dn) = NOT((operand1 AND operand3) OR (operand2 AND NOT(operand3)));
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

NEG

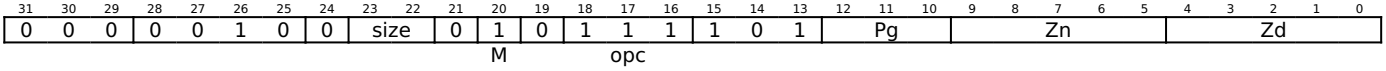
Negate (predicated)

This instruction negates the signed integer value in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

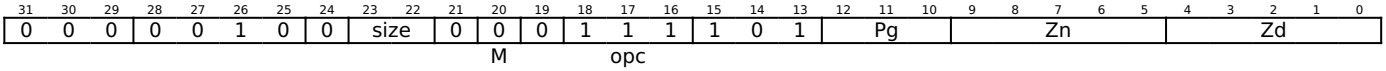
```
NEG <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
NEG <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        var element : integer = SInt(operand[e*:esize]);
        element = -element;
        result[e*:esize] = element[esize-1:0];

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

NMATCH

Detect no matching elements within quadwords, setting the condition flags

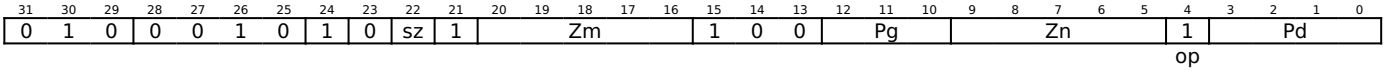
This instruction compares each Active 8-bit or 16-bit element in the first source vector with all of the elements in the corresponding 128-bit segment of the second source vector. For each element in the first source vector, if no matching element is found in the corresponding segment of the second source vector, the corresponding element of the destination predicate is set to true, otherwise it is set to false. Inactive elements in the destination predicate register are set to zero.

This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE2

(FEAT_SVE2)



Encoding

```
NMATCH <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(sz);
let g : integer = UInt(Pg);
let d : integer = UInt(Pd);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	B
1	H

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let segmentbase : integer = e - (e MOD eltspersegment);
        result[e*:psize] = ZeroExtend{psize}('1');
        let element1 : bits(esize) = operand1[e*:esize];
        for i = segmentbase to (segmentbase + eltspersegment) - 1 do
            let element2 : bits(esize) = operand2[i*:esize];
            if element1 == element2 then
                result[e*:psize] = ZeroExtend{psize}('0');
            end;
        end;
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
P{PL}(d) = result;
```

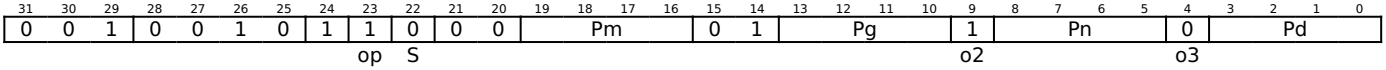
NOR

Bitwise NOR predicates

This instruction performs a bitwise NOR between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NOR <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(NOT(element1 OR element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

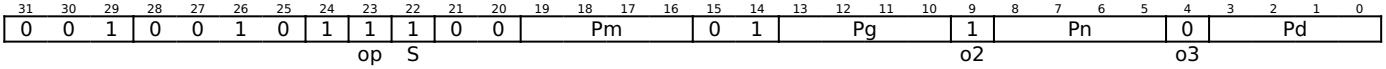
NORS

Bitwise NOR predicates, setting the condition flags

This instruction performs a bitwise NOR between the Active elements of the first source predicate and the corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NORS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(NOT(element1 OR element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

NOT (predicate)

Bitwise invert predicate

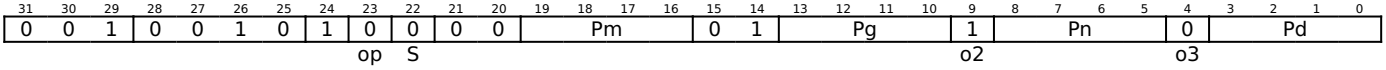
This instruction performs a bitwise invert of each Active element of the source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

This is an alias of EOR (predicates). This means:

- The encodings in this description are named to match the encodings of EOR (predicates).
- The description of EOR (predicates) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NOT <Pd>.B, <Pg>/Z, <Pn>.B
```

is equivalent to

```
EOR <Pd>.B, <Pg>/Z, <Pn>.B, <Pg>.B
```

and is the preferred disassembly when `Pm == Pg`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of EOR (predicates) gives the operational pseudocode for this instruction.

Operational Information

The description of EOR (predicates) gives the operational information for this instruction.

NOTS

Bitwise invert predicate, setting the condition flags

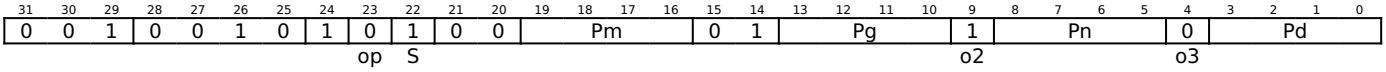
This instruction performs a bitwise invert of each Active element of the source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This is an alias of EORS. This means:

- The encodings in this description are named to match the encodings of EORS.
- The description of EORS gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
NOTS <Pd>.B, <Pg>/Z, <Pn>.B
```

is equivalent to

```
EORS <Pd>.B, <Pg>/Z, <Pn>.B, <Pg>.B
```

and is the preferred disassembly when `Pm == Pg`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

The description of EORS gives the operational pseudocode for this instruction.

Operational Information

The description of EORS gives the operational information for this instruction.

ORN (immediate)

Bitwise inclusive OR with inverted immediate (unpredicated)

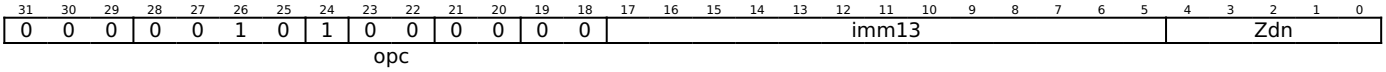
This instruction performs a bitwise inclusive OR between an inverted immediate and each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of ORR (immediate). This means:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of ORR (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ORN <Zdn>.<T>, <Zdn>.<T>, #<const>
```

is equivalent to

```
ORR <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

The description of ORR (immediate) gives the operational pseudocode for this instruction.

Operational Information

The description of ORR (immediate) gives the operational information for this instruction.

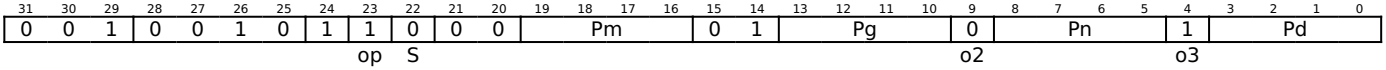
ORN (predicates)

Bitwise inclusive OR inverted predicate

This instruction performs a bitwise inclusive OR between the Active elements of the first source predicate and the inverted corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
ORN <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 OR (NOT element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

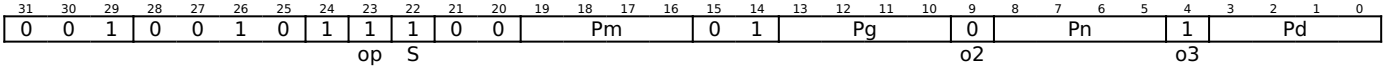
ORNS

Bitwise inclusive OR inverted predicate, setting the condition flags

This instruction performs a bitwise inclusive OR between the Active elements of the first source predicate and the inverted corresponding elements of the second source predicate, and places the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
ORNS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1 OR (NOT element2));
    else
        result[e*:psize] = ZeroExtend{psize}('0');
    end;
end;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
end;
P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

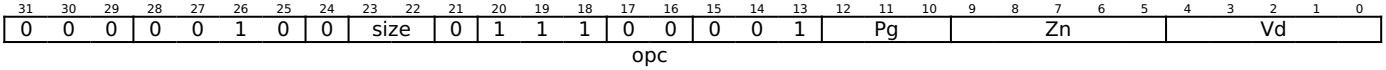
ORQV

Bitwise inclusive OR reduction of quadword vector segments

This instruction performs a bitwise inclusive OR between elements in the same position from each 128-bit source vector segment, and places each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as all zeros.

SVE2

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
ORQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p1) && !IsFeatureImplemented(FEAT_SME2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<Vd> Is the name of the destination SIMD&FP register, encoded in the "Vd" field.

<T> Is an arrangement specifier, encoded in “size”:

size	<T>
00	16B
01	8H
10	4S
11	2D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let segments : integer = VL DIV 128;
let elempersegment : integer = 128 DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(128) = Zeros{};
var stmp : bits(128) = Zeros{};

var dtmp : bits(esize);

for e = 0 to elempersegment-1 do
    dtmp = Zeros{esize};
    for s = 0 to segments-1 do
        if ActivePredicateElement{PL}(mask, s * elempersegment + e, esize) then
            stmp = operand[s*:128];
            dtmp = dtmp OR stmp[e*:esize];
        end;
    end;
    result[e*:esize] = dtmp[esize-1:0];
end;

V{128}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

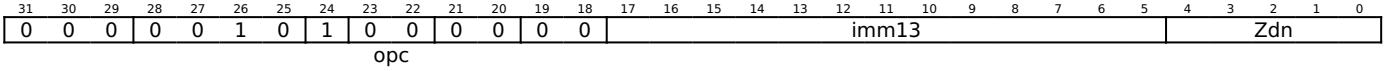
ORR (immediate)

Bitwise inclusive OR with immediate (unpredicated)

This instruction performs a bitwise inclusive OR between an immediate and each 64-bit element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32, or 64 bits. This instruction is unpredicated.
This instruction is used by the pseudo-instruction ORN (immediate).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ORR <Zdn>.<T>, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let dn : integer = UInt(Zdn);
var imm : bits(64);
(imm, -) = DecodeBitMasks{64}(imm13[12], imm13[5:0], imm13[11:6], TRUE);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13”:

imm13	<T>
0xxxxxx0xxxxx	S
0xxxxxx10xxxx	H
0xxxxxx110xxx	B
0xxxxxx1110xx	B
0xxxxxx11110x	B
0xxxxxx11111x	RESERVED
1xxxxxxxxxxxx	D

<const> Is a 64, 32, 16, or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32, or 64-bit fields, each field containing a rotated run of nonzero bits, encoded in the "imm13" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand[e*:64];
    result[e*:64] = element1 OR imm;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

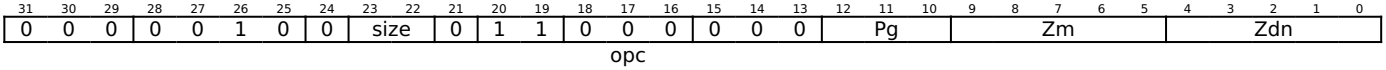
ORR (vectors, predicated)

Bitwise inclusive OR (predicated)

This instruction performs a bitwise inclusive OR between the Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ORR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize) = operand1[e*:esize];
    let element2 : bits(esize) = operand2[e*:esize];
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = element1 OR element2;
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

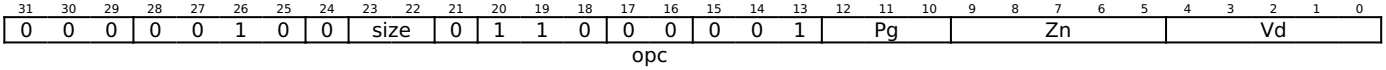
ORV

Bitwise inclusive OR reduction to scalar

This instruction performs a bitwise inclusive OR between the elements of the source vector, and places the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as zero.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ORV <V><d>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(esize) = Zeros{esize};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result = result OR operand[e*:esize];

    end;
end;
V{esize}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PEXT (predicate pair)

Predicate extract pair from predicate-as-counter

This instruction converts the source predicate-as-counter into a four register wide predicate-as-mask, and copies the two portions of the mask value selected by the portion index to the two destination predicate registers. A portion corresponds to a one predicate register fraction of the wider predicate-as-mask value.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)

Encoding

```
PEXT { <Pd1>.<T>, <Pd2>.<T> }, <PNn>[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt('1'::PNn);
let d0 : integer = UInt(Pd);
let d1 : integer = (UInt(Pd) + 1) MOD 16;
let part : integer = UInt(i1);
```

Assembler Symbols

<Pd1> Is the name of the first destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pd2> Is the name of the second destination scalable predicate register, encoded in the "Pd" field.

<PNn> Is the name of the first source scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNn" plus 8.

<imm> Is the portion index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then CheckSVEEnabled(); else CheckStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let pred : bits(PL) = P{}(n);
let mask : bits(PL*4) = CounterToPredicate{}(pred[15:0]);
var result0 : bits(PL);
var result1 : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let pbit : bit = PredicateElement{PL*4}(mask, part * 2 * elements + e, esize);
    result0[e*:psize] = ZeroExtend{psize}(pbit);
end;

for e = 0 to elements-1 do
    let pbit : bit = PredicateElement{PL*4}(mask, part * 2 * elements + elements + e, esize);
    result1[e*:psize] = ZeroExtend{psize}(pbit);
end;

P{PL}(d0) = result0;
P{PL}(d1) = result1;
```

PEXT (predicate)

Predicate extract from predicate-as-counter

This instruction converts the source predicate-as-counter into a four register wide predicate-as-mask, and copies the portion of the mask value selected by the portion index to the destination predicate register. A portion corresponds to a one predicate register fraction of the wider predicate-as-mask value.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)

Encoding

```
PEXT <Pd>.<T>, <PNn>[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt('1'::PNn);
let d : integer = UInt(Pd);
let part : integer = UInt(imm2);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<PNn> Is the name of the first source scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNn" plus 8.

<imm> Is the portion index, in the range 0 to 3, encoded in the "imm2" field.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then CheckSVEEnabled(); else CheckStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let pred : bits(PL) = P{}(n);
let mask : bits(PL*4) = CounterToPredicate{}(pred[15:0]);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let pbit : bit = PredicateElement{PL*4}(mask, part * elements + e, esize);
    result[e*:psize] = ZeroExtend{psize}(pbit);
end;

P{PL}(d) = result;
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

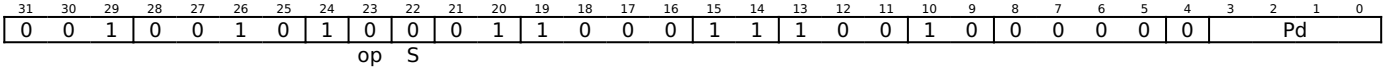
PFALSE

Set all predicate elements to false

This instruction sets all elements in the destination predicate to false.
For programmer convenience, an assembler must also accept predicate-as-counter register name for the destination predicate register.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PFALSE <Pd>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let d : integer = UInt(Pd);
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
P{PL}(d) = Zeros{PL};
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

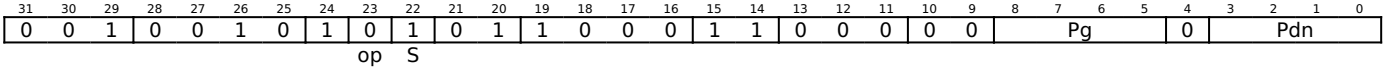
PFIRST

Set the First active predicate element to true

This instruction sets the First active element in the destination predicate to true, otherwise elements from the source predicate are passed through unchanged. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PFIRST <Pdn>.B, <Pg>, <Pdn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let dn : integer = UInt(Pdn);
```

Assembler Symbols

<Pdn>	Is the name of the source and destination scalable predicate register, encoded in the "Pdn" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var result : bits(PL) = P{}(dn);
var first : integer = -1;
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) && first == -1 then
        first = e;
    end;
end;

if first >= 0 then
    result[first*:psize] = ZeroExtend{psize}('1');
end;

PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
P{PL}(dn) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

PMLAL

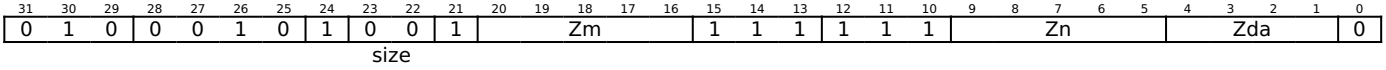
Multi-vector polynomial multiply long and accumulate

This instruction performs a polynomial multiplication over [0, 1] of the even-numbered elements of the first source vector by the corresponding elements of the second source vector, and then performs a bitwise exclusive-OR between the result and the overlapping double-width elements of the first destination vector. The same operation is performed with odd-numbered elements of the source vectors, writing to the second destination vector. This instruction is unpredicated.

This instruction is legal when executed in Streaming SVE mode if both FEAT_SSVE_AES and FEAT_SVE_AES2 are implemented.

SVE2

(FEAT_SVE_AES2)



Encoding

```
PMLAL { <Zda1>.Q-<Zda2>.Q }, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda::'0');
```

Assembler Symbols

<Zda1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zda" times 2.
<Zda2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zda" times 2 plus 1.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_AES) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result_lo : bits(VL) = Z{}(da + 0);
var result_hi : bits(VL) = Z{}(da + 1);

for e = 0 to elements-1 do
    let element1_lo : bits(esize DIV 2) = operand1[(2*e + 0)*:(esize DIV 2)];
    let element2_lo : bits(esize DIV 2) = operand2[(2*e + 0)*:(esize DIV 2)];
    let element1_hi : bits(esize DIV 2) = operand1[(2*e + 1)*:(esize DIV 2)];
    let element2_hi : bits(esize DIV 2) = operand2[(2*e + 1)*:(esize DIV 2)];
    let product_lo : bits(esize) = PolynomialMult{esize DIV 2, esize DIV 2}(element1_lo,
                                                                            element2_lo);
    let product_hi : bits(esize) = PolynomialMult{esize DIV 2, esize DIV 2}(element1_hi,
                                                                            element2_hi);
    result_lo[e*:esize] = result_lo[e*:esize] XOR product_lo;
    result_hi[e*:esize] = result_hi[e*:esize] XOR product_hi;
end;

Z{VL}(da + 0) = result_lo;
Z{VL}(da + 1) = result_hi;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PMOV (to predicate)

Move predicate from vector

This instruction copies a packed bitmap, where bit value 0b1 represents TRUE and bit value 0b0 represents FALSE, from a portion of the source vector register to elements of the destination SVE predicate register.

Because the number of bits in an SVE predicate element scales with the vector element size, the behavior varies according to the specified element size.

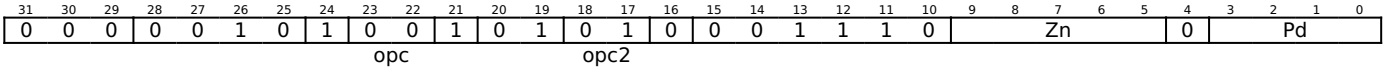
- When the predicate element specifier is B, each bit [N] from the least-significant VL/8 bits in the source vector register is copied to bit [N] of the destination predicate register. The portion index, if specified, must be 0.
- When the predicate element specifier is H, each bit [N] within the indexed block of VL/16 bits in the source vector register is copied to bit [N*2] of the destination predicate register, and the other bits in the predicate are set to zero. The portion index is in the range 0 to 1, inclusive.
- When the predicate element specifier is S, each bit [N] within the indexed block of VL/32 bits in the source vector register is copied to bit [N*4] of the destination predicate register, and the other bits in the predicate are set to zero. The portion index is in the range 0 to 3, inclusive.
- When the predicate element specifier is D, each bit [N] within the indexed block of VL/64 bits in the source vector register is copied to bit [N*8] of the destination predicate register, and the other bits in the predicate are set to zero. The portion index is in the range 0 to 7, inclusive.

The portion index is optional, defaulting to 0 if omitted.

It has encodings from 4 classes: Byte , Doubleword , Halfword and Word

Byte

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
PMOV <Pd>.B, <Zn>
```

Decode for this encoding

PMOV (to vector)

Move predicate to vector

This instruction copies the source SVE predicate register elements into the destination vector register as a packed bitmap with one bit per predicate element, where bit value 0b1 represents a TRUE predicate element, and bit value 0b0 represents a FALSE predicate element.

Because the number of bits in an SVE predicate element scales with the vector element size, the behavior varies according to the specified element size.

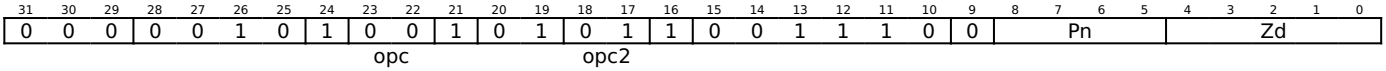
- When the predicate element specifier is B, every bit in the predicate register is copied to the least-significant VL/8 bits of the destination vector register. The portion index, if specified, must be 0.
- When the predicate element specifier is H, every second bit in the predicate register is copied to the indexed block of VL/16 bits in the destination vector register, where the portion index is in the range 0 to 1, inclusive.
- When the predicate element specifier is S, every fourth bit in the predicate register is copied to the indexed block of VL/32 bits in the destination vector register, where the portion index is in the range 0 to 3, inclusive.
- When the predicate element specifier is D, every eighth bit in the predicate register is copied to the indexed block of VL/64 bits in the destination vector register, where the portion index is in the range 0 to 7, inclusive.

The portion index is optional, defaulting to 0 if omitted. When the index is zero, the instruction writes zeros to the most significant VL-(VL/esize) bits of the destination vector register. When a nonzero index is specified, the packed bitmap is inserted into the destination vector register, and the unindexed blocks remain unchanged.

It has encodings from 4 classes: Byte , Doubleword , Halfword and Word

Byte

(FEAT_SVE2p1 || FEAT_SME2p1)



Encoding

```
PMOV <Zd>, <Pn>.B
```

PMULL

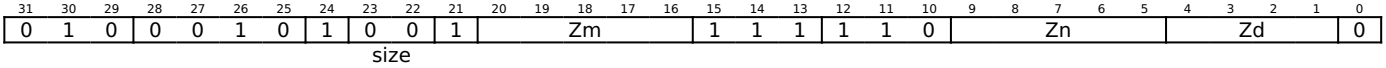
Multi-vector polynomial multiply long

This instruction performs a polynomial multiplication over [0, 1] of the even-numbered elements of the first source vector by the corresponding elements of the second source vector, and places the results in the overlapping double-width elements of the first destination vector. The same operation is performed with odd-numbered elements of the source vectors, writing to the second destination vector. This instruction is unpredicated.

This instruction is legal when executed in Streaming SVE mode if both FEAT_SSVE_AES and FEAT_SVE_AES2 are implemented.

SVE2

(FEAT_SVE_AES2)



Encoding

```
PMULL { <Zd1>.Q-<Zd2>.Q }, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_AES2) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd::'0');
```

Assembler Symbols

<Zd1>	Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.
<Zd2>	Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SSVE_AES) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result_lo : bits(VL);
var result_hi : bits(VL);

for e = 0 to elements-1 do

PMULLB

Polynomial multiply long (bottom)

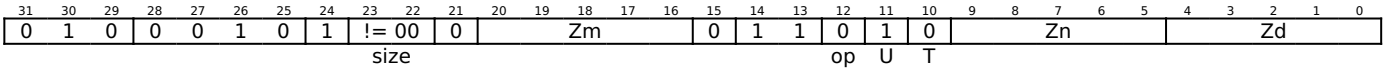
This instruction performs a polynomial multiplication over [0, 1] of the even-numbered elements of the first source vector by the corresponding elements of the second source vector, and places the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.
ID_AA64ZFR0_EL1.AES indicates whether the 128-bit element variant is implemented. The 128-bit element variant is legal when executed in Streaming SVE mode if one of the following is true:

- Both FEAT_SSVE_AES and FEAT_SVE_PMULL128 are implemented.
- FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 16-bit or 64-bit elements and 128-bit element

16-bit or 64-bit elements

(FEAT_SVE2 || FEAT_SME)



Encoding

```
PMULLB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);

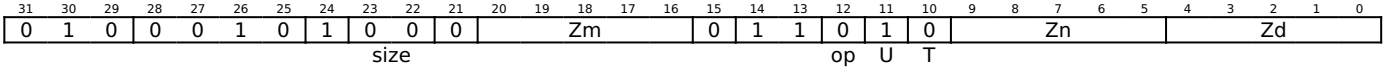
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

128-bit element

(FEAT_SVE_PMULL128)



Encoding

```
PMULLB <Zd>.Q, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_PMULL128) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	RESERVED
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
01	B
10	RESERVED
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if esize == 128 then
    if IsFeatureImplemented(FEAT_SSVE_AES) then
        CheckSVEEnabled();
    else
        CheckNonStreamingSVEEnabled();
    end;
else
    CheckSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize DIV 2) = operand1[(2*e + 0)*:(esize DIV 2)];
    let element2 : bits(esize DIV 2) = operand2[(2*e + 0)*:(esize DIV 2)];
    result[e*:esize] = PolynomialMult{esize DIV 2, esize DIV 2}(element1, element2);
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PMULLT

Polynomial multiply long (top)

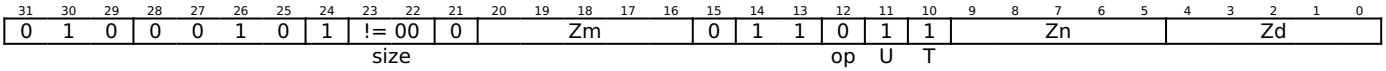
This instruction performs a polynomial multiplication over [0, 1] of the odd-numbered elements of the first source vector by the corresponding elements of the second source vector, and places the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.
ID_AA64ZFR0_EL1.AES indicates whether the 128-bit element variant is implemented. The 128-bit element variant is legal when executed in Streaming SVE mode if one of the following is true:

- Both FEAT_SSVE_AES and FEAT_SVE_PMULL128 are implemented.
- FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 16-bit or 64-bit elements and 128-bit element

16-bit or 64-bit elements

(FEAT_SVE2 || FEAT_SME)



Encoding

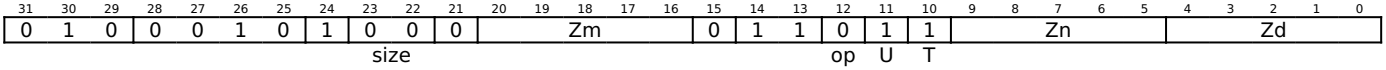
```
PMULLT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '10' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

128-bit element

(FEAT_SVE_PMULL128)



Encoding

```
PMULLT <Zd>.Q, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_PMULL128) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 128;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
01	H
10	RESERVED
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
01	B
10	RESERVED
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if esize == 128 then
    if IsFeatureImplemented(FEAT_SSVE_AES) then
        CheckSVEEnabled();
    else
        CheckNonStreamingSVEEnabled();
    end;
else
    CheckSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(esize DIV 2) = operand1[(2*e + 1)*:(esize DIV 2)];
    let element2 : bits(esize DIV 2) = operand2[(2*e + 1)*:(esize DIV 2)];
    result[e*:esize] = PolynomialMult{esize DIV 2, esize DIV 2}(element1, element2);
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

PNEXT

Find next active predicate

This instruction constructs a loop that iterates over all true elements in the vector select predicate register. If all elements in the first source predicate register are false it determines the first true element in the vector select predicate register, otherwise it determines the next true element in the vector select predicate register that follows the last true element in the first source predicate register. All elements of the destination predicate register are set to false, except the element corresponding to the determined vector select element, if any, which is set to true. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
PNEXT <Pdn>.<T>, <Pv>, <Pdn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let v : integer = UInt(Pv);
let dn : integer = UInt(Pdn);
```

Assembler Symbols

<Pdn> Is the name of the first source and destination scalable predicate register, encoded in the "Pdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register, encoded in the "Pv" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer{} = VL DIV esize;
let mask : bits(PL) = P{}(v);
let operand : bits(PL) = P{}(dn);
var result : bits(PL) = Zeros{PL};
let psize : integer{} = esize DIV 8;

var next : integer = LastActiveElement{PL}(operand, esize) + 1;

while next < elements && (!ActivePredicateElement{PL}(mask, next, esize)) looplimit elements do
    next = next + 1;
end;

if next < elements then
    result[next*:psize] = ZeroExtend{psize}('1');
end;

PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
P{PL}(dn) = result;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

PRFB (scalar plus immediate)

Contiguous prefetch bytes (immediate index)

This instruction prefetches contiguous byte elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

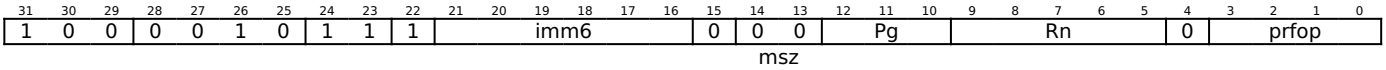
Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PRFB <prfop>, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 0;
let offset : integer = SInt(imm6);
```

Assembler Symbols

<prfop> Is the prefetch operation specifier, encoded in “prfop”:

prfop	<prfop>
0000	PLDL1KEEP
0001	PLDL1STRM
0010	PLDL2KEEP
0011	PLDL2STRM
0100	PLDL3KEEP

PRFB (scalar plus scalar)

Contiguous prefetch bytes (scalar index)

This instruction prefetches contiguous byte elements from the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element prefetch the index value is incremented, but the index register is not updated.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

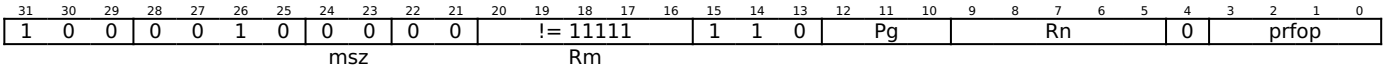
Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PRFB <prfop>, <Pg>, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);

PRFB (scalar plus vector)

Gather prefetch bytes (scalar plus vector)

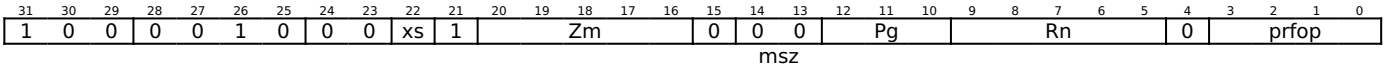
This instruction performs a gather prefetch of bytes from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign-extended or zero-extended from 32 to 64 bits. Inactive addresses are not prefetched from memory.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.
It has encodings from 3 classes: 32-bit scaled offset , 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

```
PRFB <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);

PRFD (scalar plus immediate)

Contiguous prefetch doublewords (immediate index)

This instruction prefetches contiguous doubleword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

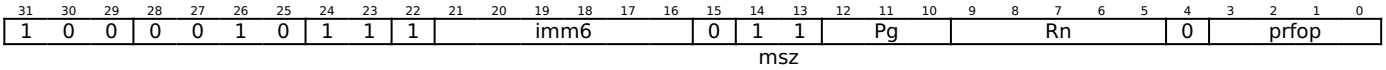
Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PRFD <prfop>, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 3;
let offset : integer = SInt(imm6);
```

Assembler Symbols

PRFD (scalar plus scalar)

Contiguous prefetch doublewords (scalar index)

This instruction prefetches contiguous doubleword elements from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 8 and added to the base address. After each element prefetch the index value is incremented, but the index register is not updated.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

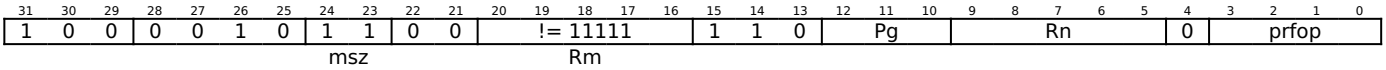
Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PRFD <prfop>, <Pg>, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 3;
```

PRFH (scalar plus immediate)

Contiguous prefetch halfwords (immediate index)

This instruction prefetches contiguous halfword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

PRFH (vector plus immediate)

Gather prefetch halfwords (vector plus immediate)

This instruction performs a gather prefetch of halfwords from the active memory addresses generated by a vector base plus immediate index. The index is a multiple of 2 in the range 0 to 62. Inactive addresses are not prefetched from memory.

The <prfop> operand specifies the prefetch hint as follows:

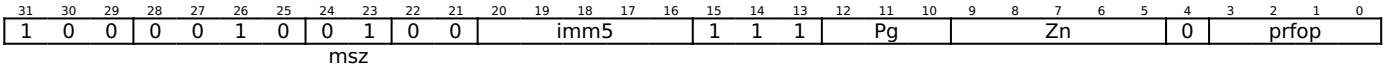
- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

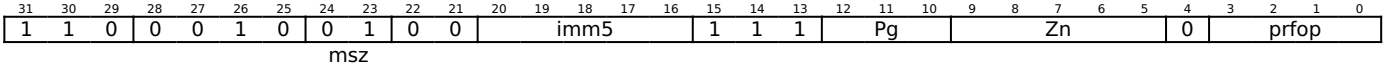
```
PRFH <prfop>, <Pg>, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 1;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
PRFH <prfop>, <Pg>, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 1;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<prfop> Is the prefetch operation specifier, encoded in “prfop”:

PRFW (scalar plus immediate)

Contiguous prefetch words (immediate index)

This instruction prefetches contiguous word elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

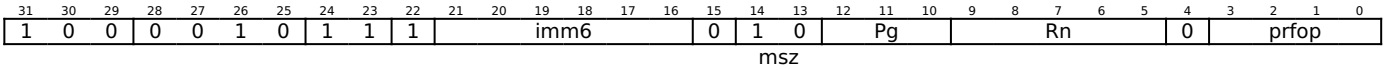
Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PRFW <prfop>, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 2;
let offset : integer = SInt(imm6);
```

Assembler Symbols

PRFW (scalar plus scalar)

Contiguous prefetch words (scalar index)

This instruction prefetches contiguous word elements from the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 4 and added to the base address. After each element prefetch the index value is incremented, but the index register is not updated.
The <prfop> operand specifies the prefetch hint as follows:

- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

Note

Arm strongly recommends the following for this instruction:

- A PE does not perform a prefetch as a result of Inactive elements.
- Software uses the predicate operand to suppress prefetches from unwanted addresses.

PRFW (scalar plus vector)

Gather prefetch words (scalar plus vector)

This instruction performs a gather prefetch of words from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then multiplied by 4. Inactive addresses are not prefetched from memory.

The <prfop> operand specifies the prefetch hint as follows:

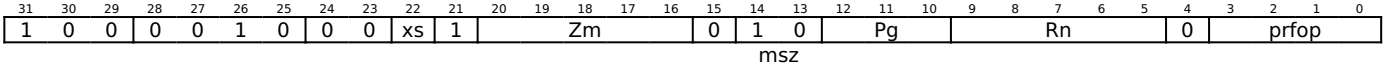
- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 32-bit scaled offset , 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

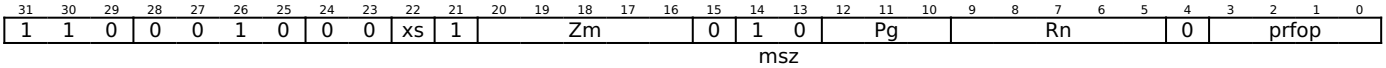
```
PRFW <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = (xs == '0');
let scale : integer = 2;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

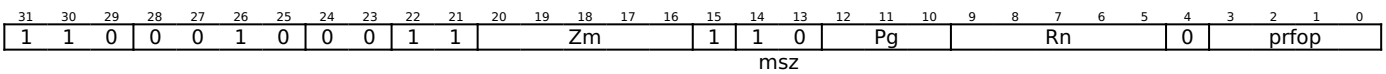
```
PRFW <prfop>, <Pg>, [<Xn|SP>, <Zm>.D, <mod> #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = (xs == '0');
let scale : integer = 2;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

```
PRFW <prfop>, <Pg>, [<Xn|SP>, <Zm>.D, LSL #2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);

PRFW (vector plus immediate)

Gather prefetch words (vector plus immediate)

This instruction performs a gather prefetch of words from the active memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive addresses are not prefetched from memory.

The <prfop> operand specifies the prefetch hint as follows:

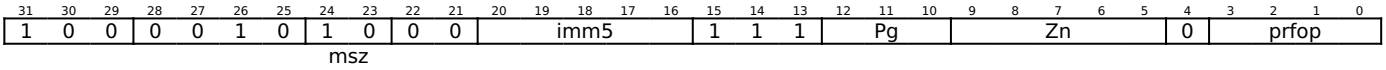
- Access type:
  - PLD for prefetch for load.
  - PST for prefetch for store.
- Target cache level:
  - L1 for Level 1 cache.
  - L2 for Level 2 cache.
  - L3 for Level 3 cache.
- Policy:
  - KEEP for retained or temporal prefetch, allocated in the cache normally.
  - STRM for streaming or non-temporal prefetch, for data that is used only once.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

(FEAT_SVE)



Encoding

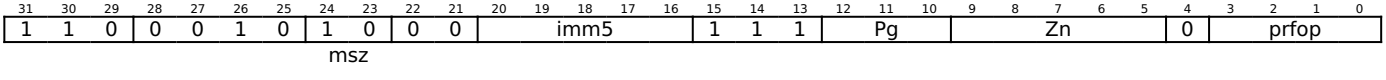
```
PRFW <prfop>, <Pg>, [<Zn>.S{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 32;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 2;
let offset : integer = UInt(imm5);
```

64-bit element

(FEAT_SVE)



Encoding

```
PRFW <prfop>, <Pg>, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 64;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let level : integer = UInt(prfop[2:1]);
let stream : boolean = (prfop[0] == '1');
let pref_hint : PrefetchHint = if prfop[3] == '0' then Prefetch_READ else Prefetch_WRITE;
let scale : integer = 2;
let offset : integer = UInt(imm5);
```

Assembler Symbols

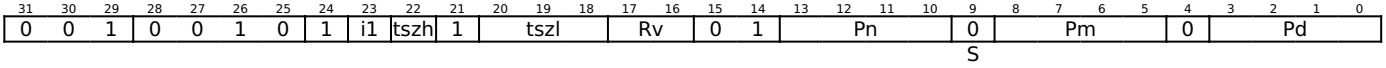
PSEL

Predicate select between predicate register or all-false

This instruction places the contents of the first source predicate register into the destination predicate register if the indexed element of the second source predicate is true, otherwise it sets the destination predicate to all-false. The indexed element is determined by the sum of a general-purpose index register and an immediate, modulo the number of elements. This instruction does not set the condition flags. For programmer convenience, an assembler must also accept predicate-as-counter register names for the destination predicate register and the first source predicate register.

SVE2

(FEAT_SME || FEAT_SVE2p1)



Encoding

```
PSEL <Pd>, <Pn>, <Pm>.<T>[<Wv>, <imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let imm5 : bits(5) = i1::tszh::tszl;
var esize : integer;
var imm : integer;
case tszh::tszl of
    when '0000' => EndOfDecode(Decode_UNDEF);
    when '1000' => esize = 64;  imm = UInt(imm5[4]);
    when 'x100' => esize = 32;  imm = UInt(imm5[4:3]);
    when 'xx10' => esize = 16;  imm = UInt(imm5[4:2]);
    when 'xxx1' => esize = 8;   imm = UInt(imm5[4:1]);
end;
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
let v : integer = UInt('011'::Rv);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
0	000	RESERVED
x	xx1	B
x	x10	H
x	100	S
1	000	D

<Wv> Is the 32-bit name of the vector select register W12-W15, encoded as "Rv" plus 12.

<imm> Is the element index, in the range 0 to one less than the number of vector elements in a 128-bit vector register, encoded in "i1:tszh:tszl".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
let idx : bits(32) = X{}(v);
let element : integer = (UInt(idx) + imm) MOD elements;
var result : bits(PL);

if ActivePredicateElement{PL}(operand2, element, esize) then
    result = operand1;
else
    result = Zeros{PL};
end;

P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

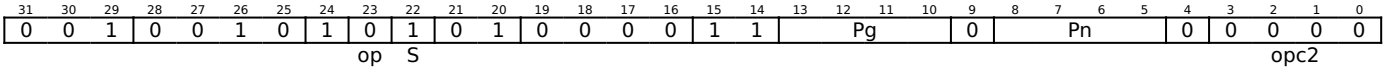
PTEST

Set condition flags for predicate

This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate source register, and sets the V flag to zero.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
PTEST <Pg>, <Pn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
```

Assembler Symbols

<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let mask : bits(PL) = P{}(g);
let result : bits(PL) = P{}(n);

PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, esize);
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the predicate register written by this instruction might be significantly delayed.

PTRUE (predicate as counter)

Initialize predicate-as-counter to all active

This instruction sets the destination predicate as all Active elements, using the predicate-as-counter encoding.

SVE2

(FEAT_SME2 || FEAT_SVE2p1)

Encoding

```
PTRUE <PNd>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt('1'::PNd);
```

Assembler Symbols

<PNd> Is the name of the destination scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNd" plus 8.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then CheckSVEEnabled(); else CheckStreamingSVEEnabled(); end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let result : bits(PL) = EncodePredCount{}(esize, elements, elements, FALSE);
P{PL}(d) = result;
```

PTRUE (predicate)

Initialize predicate from named constraint

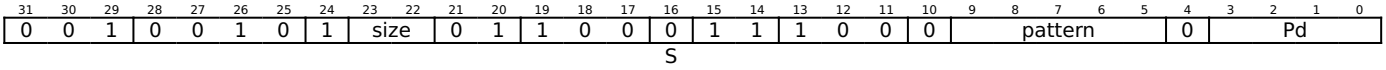
This instruction sets elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length, then all elements of the destination predicate are set to false.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
This instruction does not set the condition flags.

Not setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
PTRUE <Pd>.<T>{, <pattern>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
let pat : bits(5) = pattern;
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2

PTRUES

Initialize predicate from named constraint and set the condition flags

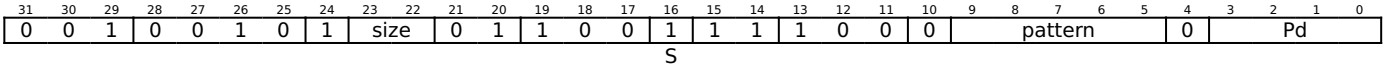
This instruction sets elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length, then all elements of the destination predicate are set to false.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

Setting the condition flags

(FEAT_SVE || FEAT_SME)



Encoding

```
PTRUES <Pd>.<T>{, <pattern>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
let pat : bits(5) = pattern;
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5

PUNPKHI, PUNPKLO

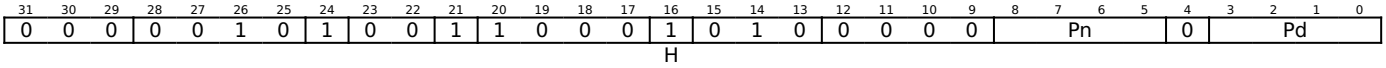
Unpack and widen half of predicate

This instruction unpacks elements from the lowest or highest half of the source predicate and places them in elements of twice their size within the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: High half and Low half

High half

(FEAT_SVE || FEAT_SME)



Encoding

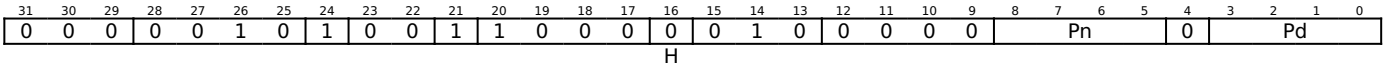
```
PUNPKHI <Pd>.H, <Pn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Pn);
let d : integer = UInt(Pd);
let hi : boolean = TRUE;
```

Low half

(FEAT_SVE || FEAT_SME)



Encoding

```
PUNPKLO <Pd>.H, <Pn>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Pn);
let d : integer = UInt(Pd);
let hi : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand : bits(PL) = P{}(n);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let pbit : bit = PredicateElement{PL}(operand, if hi then e + elements else e, esize DIV 2);
    result[e*:psize] = ZeroExtend{psize}(pbit);
end;

P{PL}(d) = result;
```

Copyright © 2010-2026 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

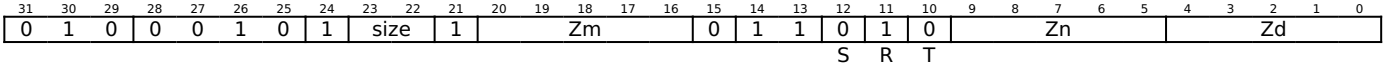
RADDHNB

Rounding add narrow high part (bottom)

This instruction adds each vector element of the first source vector to the corresponding vector element of the second source vector, and places the most significant rounded half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
RADDHNB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);
let halfesize : integer{} = esize DIV 2;

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    let res : integer = ((element1 + element2) + (1 << (halfesize - 1))) >> halfesize;
    result[(2*e + 0)*:halfesize] = res[halfesize-1:0];
    result[(2*e + 1)*:halfesize] = Zeros{halfesize};

end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

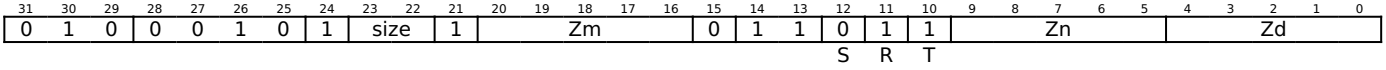
RADDHNT

Rounding add narrow high part (top)

This instruction adds each vector element of the first source vector to the corresponding vector element of the second source vector, and places the most significant rounded half of the result in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
RADDHNT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	B
10	H
11	S

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(d);
let halfesize : integer{} = esize DIV 2;

for e = 0 to elements-1 do
    let element1 : integer = UInt(operand1[e*:esize]);
    let element2 : integer = UInt(operand2[e*:esize]);
    let res : integer = ((element1 + element2) + (1 << (halfesize - 1))) >> halfesize;
    result[(2*e + 1)*:halfesize] = res[halfesize-1:0];

end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RAX1

Bitwise rotate left by 1 and exclusive-OR

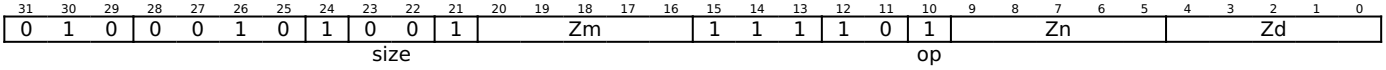
This instruction rotates each 64-bit element of the second source vector left by 1 and performs an exclusive-OR with the corresponding elements of the first source vector. The results are placed in the corresponding elements of the destination vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SHA3 indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled, or FEAT_SME2p1 is implemented.

SVE2

(FEAT_SVE_SHA3)



Encoding

```
RAX1 <Zd>.D, <Zn>.D, <Zm>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE_SHA3) then EndOfDecode(Decode_UNDEF); end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
if IsFeatureImplemented(FEAT_SME2p1) then
    CheckSVEEnabled();
else
    CheckNonStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV 64;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : bits(64) = operand1[e*:64];
    let element2 : bits(64) = operand2[e*:64];
    result[e*:64] = element1 XOR ROL(element2, 1);
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

RBIT

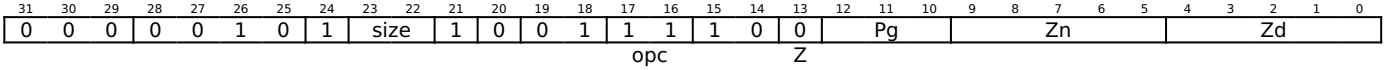
Reverse bits (predicated)

This instruction reverses the bits in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE || FEAT_SME)



Encoding

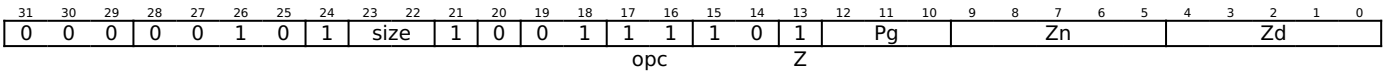
```
RBIT <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
RBIT <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = BitReverse{esize}(element);

    end;
end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

RDFFR (predicated)

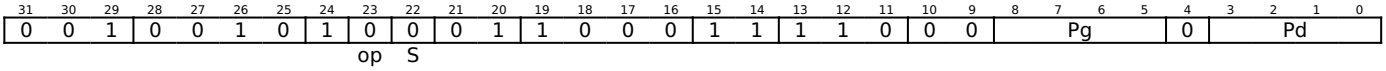
Return predicate of successfully loaded elements

This instruction reads the first-fault register (FFR) and places Active elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction does not set the condition flags.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

Not setting the condition flags

(FEAT_SVE)



Encoding

```
RDFFR <Pd>.B, <Pg>/Z
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let d : integer = UInt(Pd);
let setflags : boolean = FALSE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let mask : bits(PL) = P{}(g);
let ffr : bits(PL) = FFR{}();
let result : bits(PL) = ffr AND mask;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, 8);
end;
P{PL}(d) = result;
```

RDFFRS

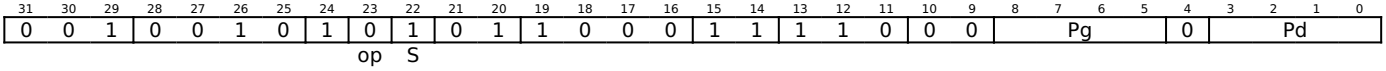
Return predicate of successfully loaded elements, setting the condition flags

This instruction reads the first-fault register (FFR) and places Active elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. This instruction sets the First (N), None (Z), and !Last (C) condition flags based on the predicate result, and sets the V flag to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

Setting the condition flags

(FEAT_SVE)



Encoding

```
RDFFRS <Pd>.B, <Pg>/Z
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let g : integer = UInt(Pg);
let d : integer = UInt(Pd);
let setflags : boolean = TRUE;
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let mask : bits(PL) = P{}(g);
let ffr : bits(PL) = FFR{}();
let result : bits(PL) = ffr AND mask;

if setflags then
    PSTATE.[N,Z,C,V] = PredTest{PL}(mask, result, 8);
end;
P{PL}(d) = result;
```

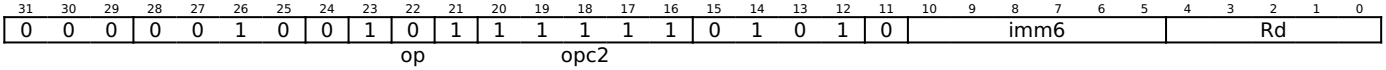
RDVL

Read multiple of vector register size to scalar register

This instruction multiplies the current vector register size in bytes by an immediate in the range -32 to 31 and places the result in the 64-bit destination general-purpose register.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
RDVL <Xd>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let d : integer = UInt(Rd);
let imm : integer = SInt(imm6);
```

Assembler Symbols

<Xd>	Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
<imm>	Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let len : integer = imm * (VL DIV 8);
X{64}(d) = len[63:0];
```

REV (predicate)

Reverse all elements in a predicate

This instruction reads all elements in the source predicate, reverses the order of all the elements, and places the result in the destination predicate. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
REV <Pd>.<T>, <Pn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Pn);
let d : integer = UInt(Pd);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let operand : bits(PL) = P{}(n);
let result : bits(PL) = Reverse{}(operand, esize DIV 8);
P{PL}(d) = result;
```

REV (vector)

Reverse all elements in a vector (unpredicated)

This instruction reads all elements in the source vector, reverses the order of all the elements, and places the result in the destination vector. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)

Encoding

```
REV <Zd>.<T>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let operand : bits(VL) = Z{}(n);
let result : bits(VL) = Reverse{}(operand, esize);
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

REVB, REVH, REVW

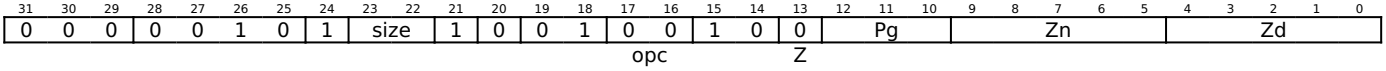
Reverse bytes / halfwords / words within elements (predicated)

This instruction reverses the order of 8-bit bytes, 16-bit halfwords or 32-bit words within each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 6 classes: Byte, merging , Byte, zeroing , Halfword, merging , Halfword, zeroing , Word, merging and Word, zeroing

Byte, merging

(FEAT_SVE || FEAT_SME)



Encoding

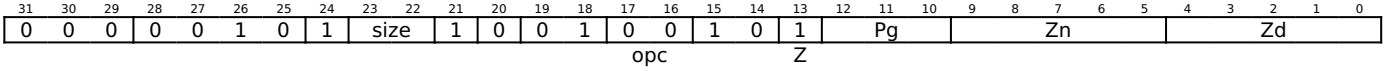
```
REVB <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 8;
let merging : boolean = TRUE;
```

Byte, zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

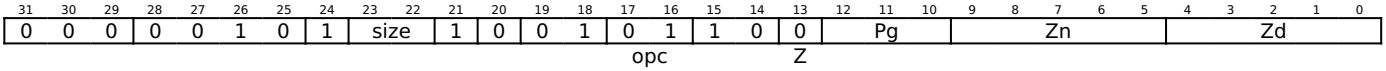
```
REVB <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 8;
let merging : boolean = FALSE;
```

Halfword, merging

(FEAT_SVE || FEAT_SME)



Encoding

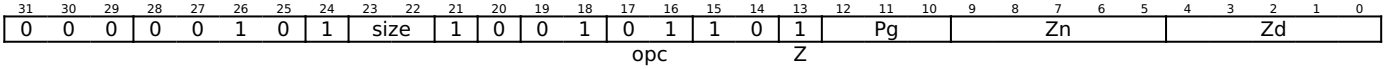
```
REVH <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size IN {'0x'} then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 16;
let merging : boolean = TRUE;
```

Halfword, zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

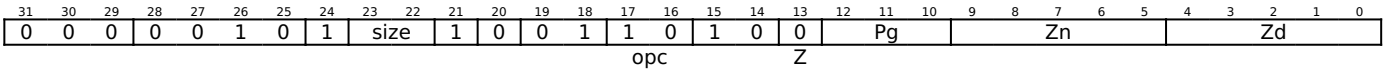
```
REVH <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size IN {'0x'} then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 16;
let merging : boolean = FALSE;
```

Word, merging

(FEAT_SVE || FEAT_SME)



Encoding

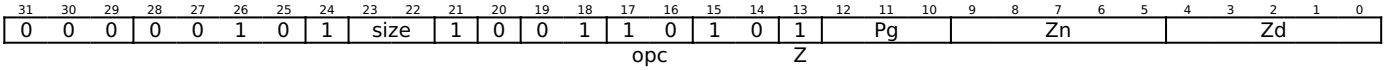
```
REVW <Zd>.D, <Pg>/M, <Zn>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 32;
let merging : boolean = TRUE;
```

Word, zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
REVW <Zd>.D, <Pg>/Z, <Zn>.D
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
if size != '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 32;
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the "Byte, merging" and "Byte, zeroing" variants: is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

For the "Halfword, merging" and "Halfword, zeroing" variants: is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = Reverse{esize}(element, swsize);
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

REVD

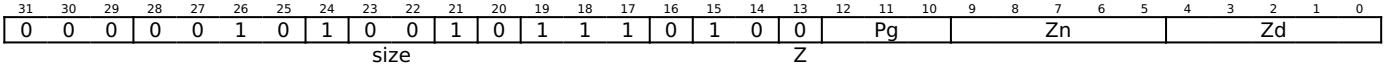
Reverse 64-bit doublewords in elements (predicated)

This instruction reverses the order of 64-bit doublewords within each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SME || FEAT_SVE2p1)



Encoding

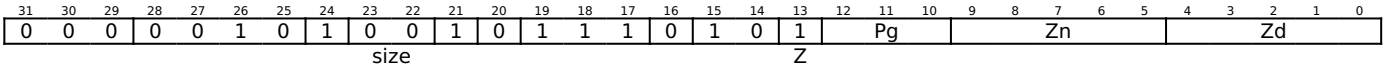
```
REVD <Zd>.Q, <Pg>/M, <Zn>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 128;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 64;
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
REVD <Zd>.Q, <Pg>/Z, <Zn>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 128;
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let swsize : integer = 64;
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : bits(esize) = operand[e*:esize];
        result[e*:esize] = Reverse{esize}(element, swsize);
    end;
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

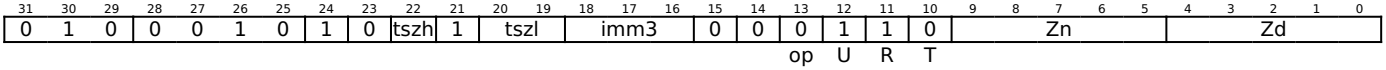
RSHRNB

Rounding shift right narrow by immediate (bottom)

This instruction shifts each unsigned integer value in the source vector elements right by an immediate value, and places the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
RSHRNB <Zd>.<T>, <Zn>.<Tb>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(3) = tszh::tszl;
if tsize == '000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
0	00	RESERVED
0	01	B
0	1x	H
1	xx	S

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

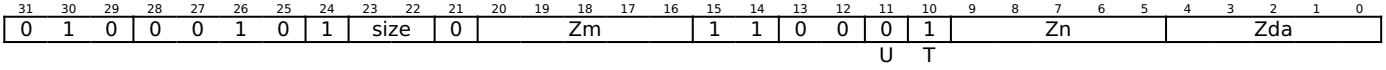
SABALT

Signed absolute difference and accumulate long (top)

This instruction calculates the absolute difference between odd-numbered signed elements of the first source vector and the corresponding elements of the second source vector, and destructively adds the results to the overlapping double-width elements of the addend vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SABALT <Zda>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[(2*e + 1)*:(esize DIV 2)]);
    let element2 : integer = SInt(operand2[(2*e + 1)*:(esize DIV 2)]);
    let absdiff = Abs(element1 - element2)[esize-1:0];
    result[e*:esize] = result[e*:esize] + absdiff;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

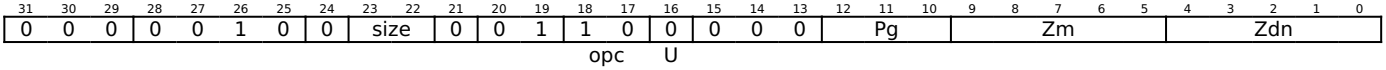
SABD

Signed absolute difference (predicated)

This instruction calculates the absolute difference between signed integer values in Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the difference in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SABD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let absdiff : integer = Abs(element1 - element2);
        result[e*:esize] = absdiff[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

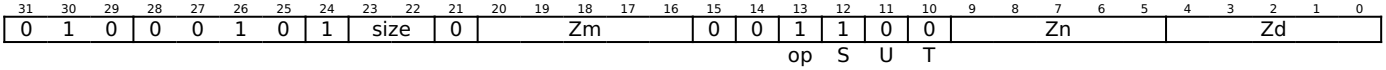
SABDLB

Signed absolute difference long (bottom)

This instruction calculates the absolute difference between even-numbered signed integer values in elements of the first source vector and the corresponding elements of the second source vector, and places the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SABDLB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[(2*e + 0)*:(esize DIV 2)]);
    let element2 : integer = SInt(operand2[(2*e + 0)*:(esize DIV 2)]);
    let res : integer = Abs(element1 - element2);
    result[e*:esize] = res[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

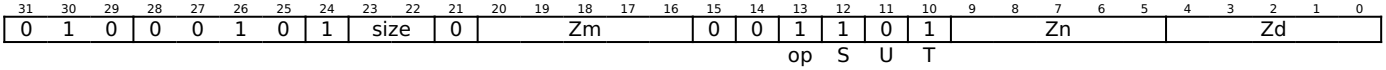
SABDLT

Signed absolute difference long (top)

This instruction calculates the absolute difference between odd-numbered signed integer values in elements of the first source vector and the corresponding elements of the second source vector, and places the results in overlapping double-width elements of the destination vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SABDLT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[(2*e + 1)*:(esize DIV 2)]);
    let element2 : integer = SInt(operand2[(2*e + 1)*:(esize DIV 2)]);
    let res : integer = Abs(element1 - element2);
    result[e*:esize] = res[esize-1:0];
end;

Z{VL}(d) = result;
```

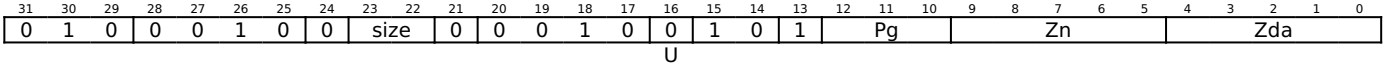
SADALP

Signed add and accumulate long pairwise

This instruction adds pairs of adjacent signed integer values and accumulates the results into the overlapping double-width elements of the destination vector.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SADALP <Zda>.<T>, <Pg>/M, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the second source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand_acc : bits(VL) = Z{}(da);

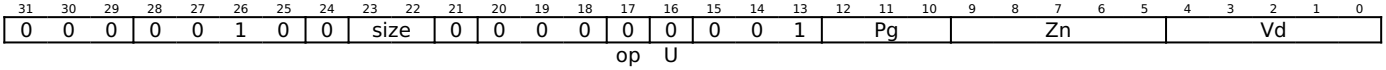
SADDV

Signed add reduction to scalar

This instruction adds all the signed elements of the source vector, and places the result in the SIMD&FP scalar destination register. Narrow elements are first sign-extended to 64 bits. Inactive elements in the source vector are treated as zero.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SADDV <Dd>, <Pg>, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '11' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Vd);
```

Assembler Symbols

<Dd> Is the 64-bit name of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	RESERVED

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = Z{}(n);
var sum : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : integer = SInt(operand[e*:esize]);
        sum = sum + element;
    end;
end;

V{64}(d) = sum[63:0];
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

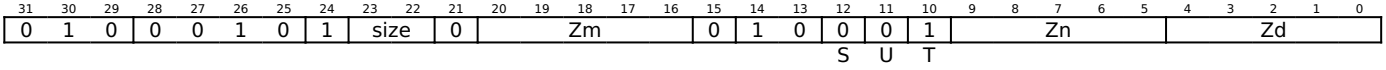
SADDWT

Signed add wide (top)

This instruction adds the odd-numbered signed elements of the second source vector to the overlapping double-width elements of the first source vector and places the results in the corresponding double-width elements of the destination vector. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SADDWT <Zd>.<T>, <Zn>.<T>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[(2*e + 1)*:(esize DIV 2)]);
    result[e*:esize] = (element1 + element2)[esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

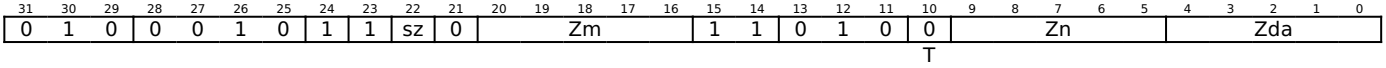
SBCLB

Subtract with carry long (bottom)

This instruction subtracts the even-numbered elements of the first source vector and the inverted 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector from the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SBCLB <Zda>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32 << UInt(sz);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let pairs : integer = VL DIV (esize * 2);
let operand : bits(VL) = Z{}(n);
let carries : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

SCVTF (predicated)

Signed integer convert to floating-point (predicated)

This instruction converts to floating-point from the signed integer in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 14 classes: 16-bit to half-precision, merging , 16-bit to half-precision, zeroing , 32-bit to half-precision, merging , 32-bit to half-precision, zeroing , 32-bit to single-precision, merging , 32-bit to single-precision, zeroing , 32-bit to double-precision, merging , 32-bit to double-precision, zeroing , 64-bit to half-precision, merging , 64-bit to half-precision, zeroing , 64-bit to single-precision, merging , 64-bit to single-precision, zeroing , 64-bit to double-precision, merging and 64-bit to double-precision, zeroing

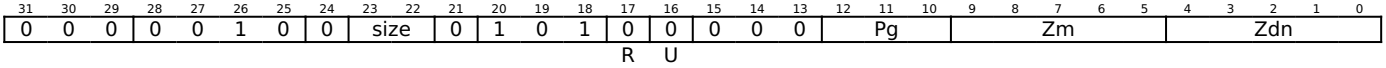
SDIV

Signed divide (predicated)

This instruction performs a signed divide on Active elements of the first source vector by the corresponding elements of the second source vector and destructively places the quotient in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SDIV <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size IN {'0x'} then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size[0]”:

size[0]	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let dividend : integer = SInt(operand1[e*:esize]);
        let divisor : integer = SInt(operand2[e*:esize]);
        var quotient : integer;
        if divisor == 0 then
            quotient = 0;
        elsif (dividend < 0) == (divisor < 0) then
            quotient = Abs(dividend) DIVRM Abs(divisor);    // same signs - positive result
        else
            quotient = -(Abs(dividend) DIVRM Abs(divisor)); // different signs - negative result
        end;
        result[e*:esize] = quotient[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.

- A predicated `MOVPRFX` must use the same governing predicate register as this instruction.
- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SDOT (2-way, indexed)

Signed integer dot product by indexed element (two-way)

This instruction calculates the dot product of a pair of signed 8-bit or 16-bit integer values held in each 16-bit or 32-bit element of the first source vector multiplied by a pair of signed 8-bit or 16-bit integer values in an indexed 16-bit or 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 16-bit or 32-bit element of the destination vector.

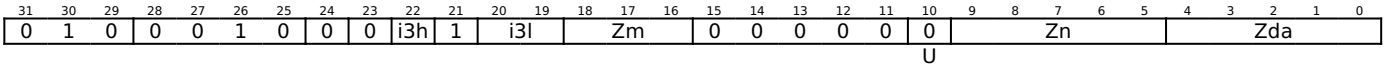
The groups within the second source vector are specified using an immediate index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 16-bit and 16-bit to 32-bit

8-bit to 16-bit

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

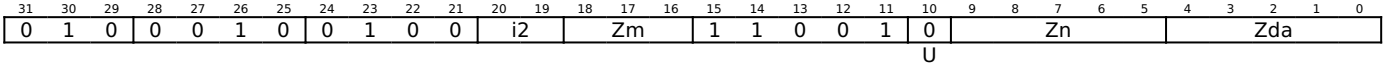
```
SDOT <Zda>.H, <Zn>.B, <Zm>.B[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

16-bit to 32-bit

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
SDOT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
<imm>	For the "8-bit to 16-bit" variant: is the immediate index of a pair of 8-bit elements within each 128-bit vector segment, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "16-bit to 32-bit" variant: is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    var res : bits(esize) = operand3[e*:esize];
    for i = 0 to 1 do
        let element1 : integer = SInt(operand1[(2 * e + i)*:(esize DIV 2)]);
        let element2 : integer = SInt(operand2[(2 * s + i)*:(esize DIV 2)]);
        res = res + element1 * element2;
    end;
    result[e*:esize] = res;
end;

Z{VL}(da) = result;
```

SEL (predicates)

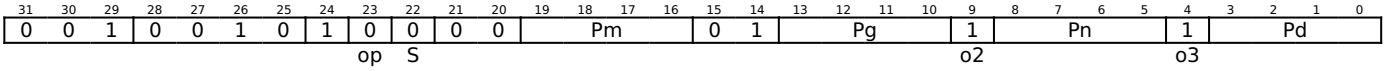
Conditionally select elements from two predicates

This instruction reads Active elements from the first source predicate and Inactive elements from the second source predicate and places them in the corresponding elements of the destination predicate. This instruction does not set the condition flags.

This instruction is used by the alias MOV (predicate, merging).

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SEL <Pd>.B, <Pg>, <Pn>.B, <Pm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let g : integer = UInt(Pg);
let n : integer = UInt(Pn);
let m : integer = UInt(Pm);
let d : integer = UInt(Pd);
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
MOV (predicate, merging)	`Pd == Pm`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(PL) = P{}(n);
let operand2 : bits(PL) = P{}(m);
var result : bits(PL);
let psize : integer{} = esize DIV 8;

for e = 0 to elements-1 do
    let element1 : bit = PredicateElement{PL}(operand1, e, esize);
    let element2 : bit = PredicateElement{PL}(operand2, e, esize);
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:psize] = ZeroExtend{psize}(element1);
    else
        result[e*:psize] = ZeroExtend{psize}(element2);
    end;
end;

P{PL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

let esize : integer{} = 8 << UInt(size);
let v : integer = UInt(Pv);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register, encoded in the "Pv" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Alias Conditions

Alias	Is preferred when
MOV (vector, predicated)	`Zd == Zm`

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(v);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
let operand2 : bits(VL) = if AnyActiveElement{PL}(NOT(mask), esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        result[e*:esize] = operand1[e*:esize];
    else
        result[e*:esize] = operand2[e*:esize];
    end;
end;

Z{VL}(d) = result;
```

SETFFR

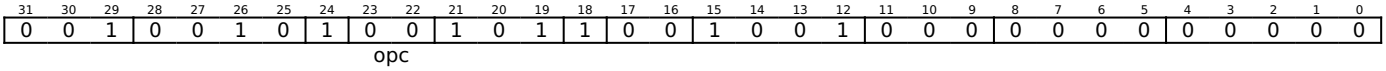
Initialize the first-fault register to all true

This instruction initializes the first-fault register (FFR) to all true prior to a sequence of first-fault or non-fault loads. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

SETFFR

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
```

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
FFR{PL}() = Ones{PL};
```

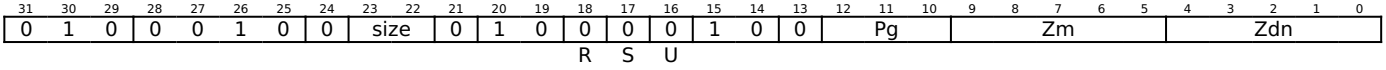
SHADD

Signed halving add

This instruction adds Active signed elements of the first source vector to the corresponding signed elements of the second source vector, shifts right one bit, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SHADD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let res : integer = (element1 + element2) >> 1;
        result[e*:esize] = res[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

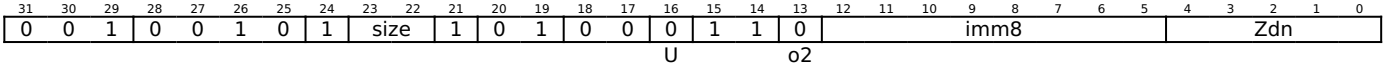
SMAX (immediate)

Signed maximum with immediate (unpredicated)

This instruction determines the signed maximum of an immediate and each element of the source vector, and destructively places the results in the corresponding elements of the source vector. The immediate is a signed 8-bit value in the range -128 to +127, inclusive. This instruction is unpredicated.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SMAX <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
let unsigned : boolean = FALSE;
let imm : integer = if unsigned then UInt(imm8) else SInt(imm8);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the signed immediate operand, in the range -128 to 127, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;

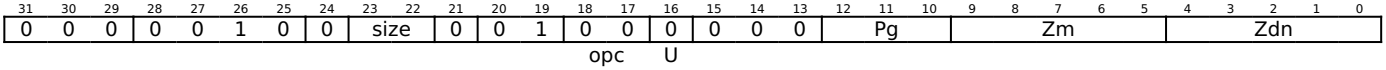
SMAX (vectors)

Signed maximum (predicated)

This instruction determines the signed maximum of Active elements of the first source vector and the corresponding elements of the second source vector, and destructively places the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SMAX <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let maximum : integer = Max(element1, element2);
        result[e*:esize] = maximum[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SMLALB (indexed)

Signed multiply-add long by indexed element (bottom)

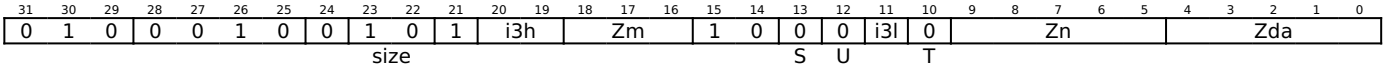
This instruction multiplies the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, and destructively adds the results to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

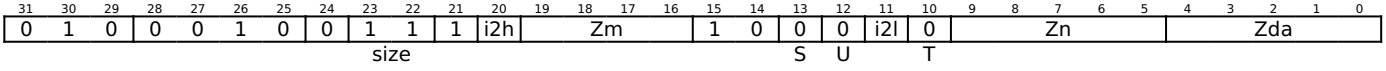
```
SMLALB <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 0;
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SMLALB <Zda>.D, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 0;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = SInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = SInt(operand2[(2 * s + index)*:esize]);
    let product : bits(2*esize) = (element1 * element2)[2*esize-1:0];
    result[e*:(2*esize)] = result[e*:(2*esize)] + product;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SMMLA

Signed 8-bit integer matrix multiply-accumulate to 32-bit integer

This instruction multiplies the 2×8 matrix of signed 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

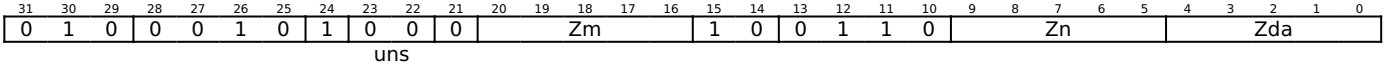
This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE && FEAT_I8MM)



Encoding

```
SMMLA <Zda>.S, <Zn>.B, <Zm>.B
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) || !IsFeatureImplemented(FEAT_I8MM) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let op1_unsigned : boolean = FALSE;
let op2_unsigned : boolean = FALSE;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let segments : integer = VL DIV 128;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL) = Zeros{};
var op1, op2 : bits(128);
var res, addend : bits(128);

for s = 0 to segments-1 do
    op1    = operand1[s*:(128)];
    op2    = operand2[s*:(128)];
    addend = operand3[s*:(128)];
    res    = MatMulAdd(addend, op1, op2, op1_unsigned, op2_unsigned);
    result[s*:(128)] = res;
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

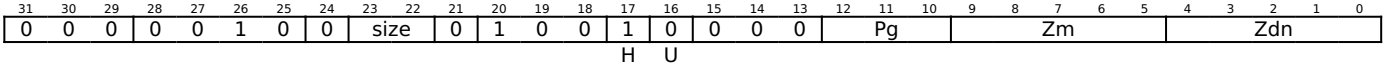
SMULH (predicated)

Signed multiply returning high half (predicated)

This instruction performs a widening multiplication of signed integer values in Active elements of the first source vector by the corresponding elements of the second source vector and destructively places the high half of the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SMULH <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let m : integer = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let product : integer = (element1 * element2) >> esize;
        result[e*:esize] = product[esize-1:0];
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.

- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SMULLB (indexed)

Signed multiply long by indexed element (bottom)

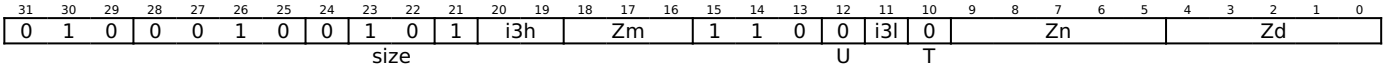
This instruction multiplies the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, and places the results in the overlapping double-width elements of the destination vector register.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

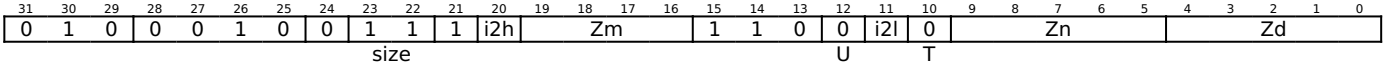
```
SMULLB <Zd>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel : integer = 0;
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SMULLB <Zd>.D, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
let sel : integer = 0;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = SInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = SInt(operand2[(2 * s + index)*:esize]);
    let res : integer = element1 * element2;
    result[e*:(2*esize)] = res[2*esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SPLICE

Splice two vectors under predicate control

This instruction selects a region from the first source vector and copies it to the lowest-numbered elements of the result. Any remaining elements of the result are set to a copy of the lowest-numbered elements from the second source vector. The region is selected using the first and last true elements in the vector select predicate register. The result is destructively placed in the destination and first source vector, or constructively placed in the destination vector.

It has encodings from 2 classes: Constructive and Destructive

Constructive

(FEAT_SVE2 || FEAT_SME)

Encoding

```
SPLICE <Zd>.<T>, <Pv>, { <Zn1>.<T>, <Zn2>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let v : integer = UInt(Pv);
let dst : integer = UInt(Zd);
let s1 : integer = UInt(Zn);
let s2 : integer = (s1 + 1) MOD 32;
```

Destructive

(FEAT_SVE || FEAT_SME)

Encoding

```
SPLICE <Zdn>.<T>, <Pv>, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let v : integer = UInt(Pv);
let dst : integer = UInt(Zdn);
let s1 : integer = dst;
let s2 : integer = UInt(Zm);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register P0-P7, encoded in the "Pv" field.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded in the "Zn" field.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded in the "Zn" field.

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(v);
let operand1 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(s1) else Zeros{VL};
let operand2 : bits(VL) = Z{}(s2);
var result : bits(VL);
var x : integer = 0;
var active : boolean = FALSE;
let lastnum : integer = LastActiveElement{PL}(mask, esize);

if lastnum >= 0 then
    for e = 0 to lastnum do
        active = active || ActivePredicateElement{PL}(mask, e, esize);
        if active then
            result[x*:esize] = operand1[e*:esize];
            x = x + 1;
        end;
    end;
end;

let nelements : integer = (elements - x) - 1;
for e = 0 to nelements do
    result[x*:esize] = operand2[e*:esize];
    x = x + 1;
end;

Z{VL}(dst) = result;
```

Operational information

For the "Destructive" variant:
The destructive variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the destructive variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQABS

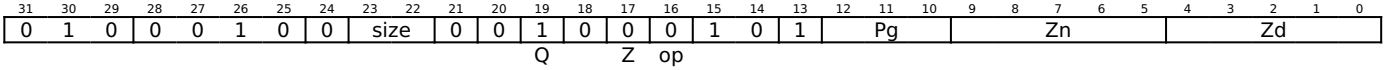
Signed saturating absolute value

This instruction calculates the absolute value of the signed integer in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2 || FEAT_SME)



Encoding

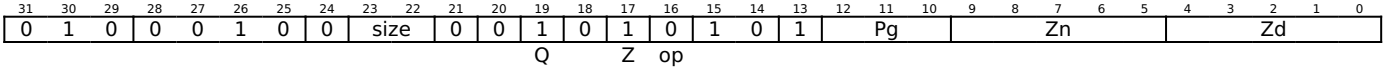
```
SQABS <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
SQABS <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do

end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

SQADD (immediate)

Signed saturating add immediate (unpredicated)

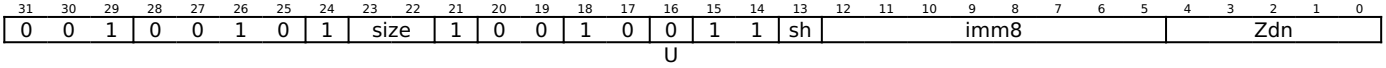
This instruction performs a signed saturating addition of an unsigned immediate to each element of the source vector, and destructively places the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SQADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
let unsigned : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
    (result[e*:esize], -) = SatQ{esize}(element1 + imm, unsigned);

end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQCADD

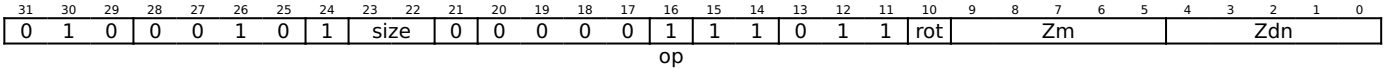
Saturating complex integer add

This instruction adds the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector that have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. The results are destructively placed in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQCADD <Zdn>.<T>, <Zdn>.<T>, <Zm>.<T>, <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then

SQDECB

Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count

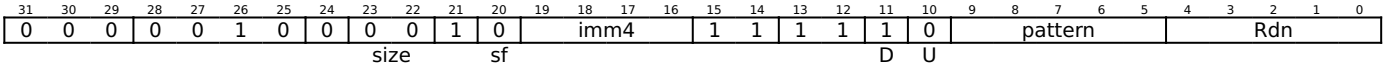
This instruction determines the number of Active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQDECB <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}
```

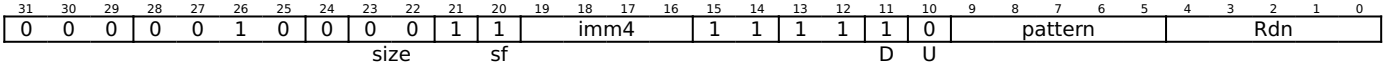
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQDECB <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1

SQDECH (scalar)

Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count

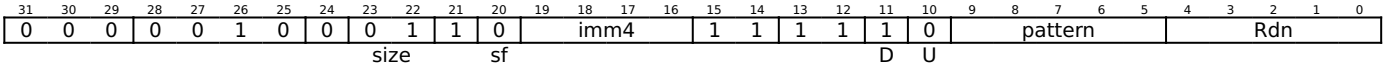
This instruction determines the number of Active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQDECH <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}
```

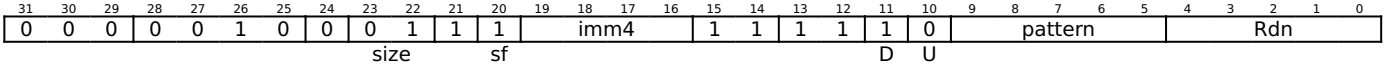
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQDECH <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

SQDECP (scalar)

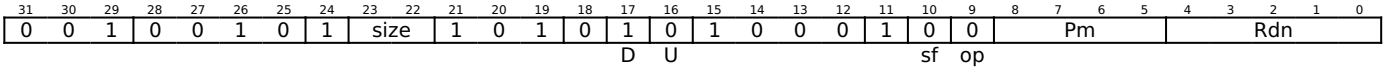
Signed saturating decrement scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

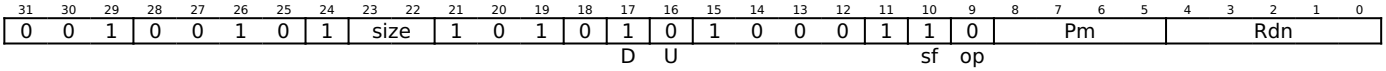
```
SQDECP <Xdn>, <Pm>.<T>, <Wdn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQDECP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(ssize) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(ssize);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

if unsigned then
    (result, -) = UnsignedSatQ{ssize}(UInt(operand1) - count);
    X{64}(dn) = ZeroExtend{64}(result);
else
    (result, -) = SignedSatQ{ssize}(SInt(operand1) - count);
    X{64}(dn) = SignExtend{64}(result);
end;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

SQDMLALB (indexed)

Signed saturating doubling multiply-add by indexed element (bottom)

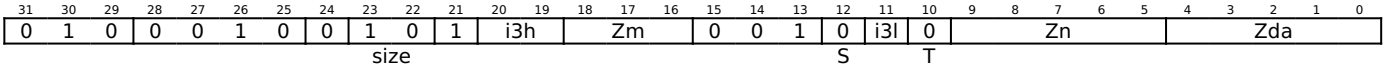
This instruction multiples the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment and then doubles the result of the multiplication. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$ and is then destructively added to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQDMLALB <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);

SQDMLALB (vectors)

Signed saturating doubling multiply-add (bottom)

This instruction multiples the even-numbered signed elements of the first source vector by the corresponding elements of the second source vector, and then doubles the result of the multiplication. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$ and is then destructively added to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

SVE2

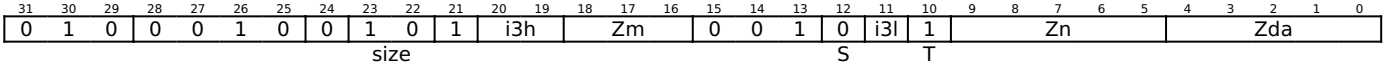
SQDMLALT (indexed)

Signed saturating doubling multiply-add by indexed element (top)

This instruction multiplies the odd-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, and then doubles the result. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$ and is then destructively added to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.
The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

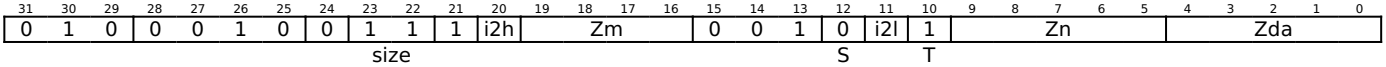
```
SQDMLALT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 1;
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQDMLALT <Zda>.D, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 1;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = SInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = SInt(operand2[(2 * s + index)*:esize]);
    let element3 : integer = SInt(result[e*:(2*esize)]);
    let product : integer = SInt(SignedSat{2*esize}(2 * element1 * element2));
    let res : integer = element3 + product;
    result[e*:(2*esize)] = SignedSat{2*esize}(res);
end;

Z{VL}(da) = result;
```

if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2h::i2l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel : integer = 1;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "32-bit" variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "32-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "64-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let eltspersegment : integer = 128 DIV (2 * esize);
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL) = Z{}(da);

for e = 0 to elements-1 do
    let s : integer = e - (e MOD eltspersegment);
    let element1 : integer = SInt(operand1[(2 * e + sel)*:esize]);
    let element2 : integer = SInt(operand2[(2 * s + index)*:esize]);
    let element3 : integer = SInt(result[e*:(2*esize)]);
    let product : integer = SInt(SignedSat{2*esize}(2 * element1 * element2));
    let res : integer = element3 - product;
    result[e*:(2*esize)] = SignedSat{2*esize}(res);
end;

Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

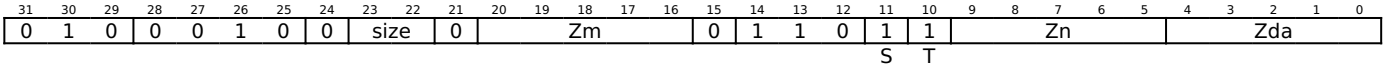
SQDMLSLT (vectors)

Signed saturating doubling multiply-subtract (top)

This instruction multiplies the odd-numbered signed elements of the first source vector by the corresponding elements of the second source vector, and then doubles the result. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$ and is then destructively subtracted from the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQDMLSLT <Zda>.<T>, <Zn>.<Tb>, <Zm>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then

SQDMULH (indexed)

Signed saturating doubling multiply high by indexed element

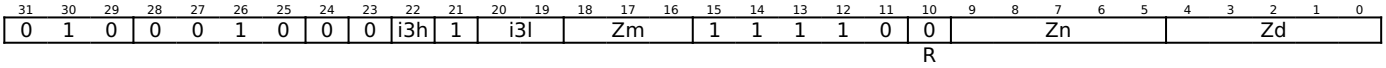
This instruction multiplies all signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, then doubles and places the most significant half of the result in the corresponding elements of the destination vector register. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

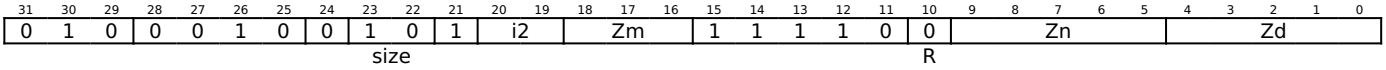
```
SQDMULH <Zd>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

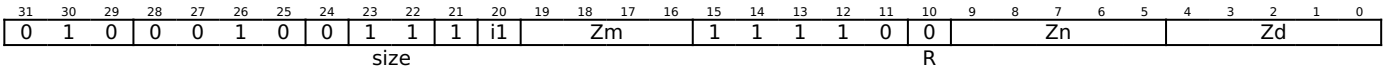
```
SQDMULH <Zd>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQDMULH <Zd>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[s*:esize]);
    let res : integer = 2 * element1 * element2;
    result[e*:esize] = SignedSat{esize}(res >> esize);

end;
Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SQINCB

Signed saturating increment scalar by multiple of 8-bit predicate constraint element count

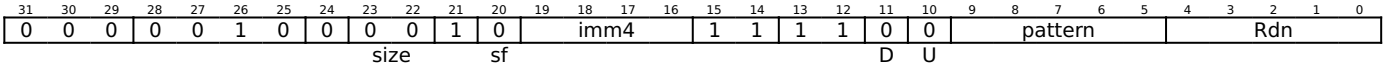
This instruction determines the number of Active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCB <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}
```

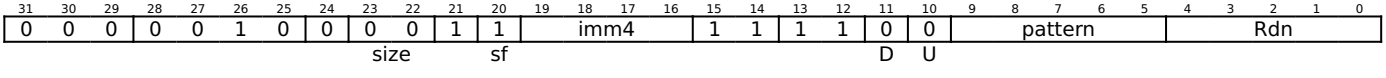
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCB <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7

SQINCD (scalar)

Signed saturating increment scalar by multiple of 64-bit predicate constraint element count

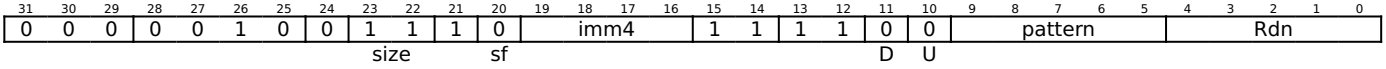
This instruction determines the number of Active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCD <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}
```

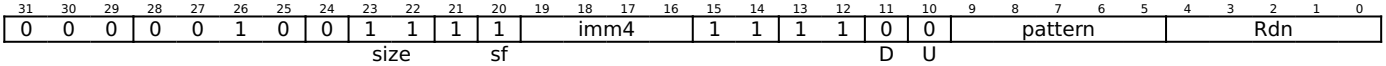
Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCD <Xdn>{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let dn : integer = UInt(Rdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>

SQINCP (scalar)

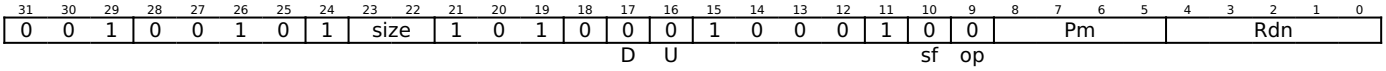
Signed saturating increment scalar by count of true predicate elements

This instruction determines the number of true elements in the source predicate and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

(FEAT_SVE || FEAT_SME)



Encoding

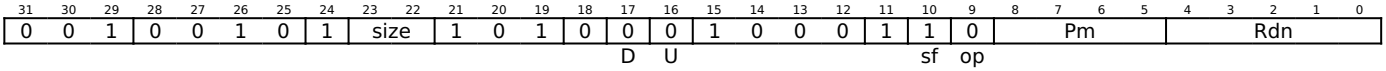
```
SQINCP <Xdn>, <Pm>.<T>, <Wdn>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = FALSE;
let  ssize : integer{} = 32;
```

64-bit

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCP <Xdn>, <Pm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let m : integer = UInt(Pm);
let dn : integer = UInt(Rdn);
let unsigned : boolean = FALSE;
let  ssize : integer{} = 64;
```

Assembler Symbols

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(ssize) = X{}(dn);
let operand2 : bits(PL) = P{}(m);
var result : bits(ssize);
var count : integer = 0;

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(operand2, e, esize) then
        count = count + 1;
    end;
end;

if unsigned then
    (result, -) = UnsignedSatQ{ssize}(UInt(operand1) + count);
    X{64}(dn) = ZeroExtend{64}(result);
else
    (result, -) = SignedSatQ{ssize}(SInt(operand1) + count);
    X{64}(dn) = SignExtend{64}(result);
end;
```

Operational information

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction that is dependent on the general-purpose register written by this instruction might be significantly delayed.

SQINCW (vector)

Signed saturating increment vector by multiple of 32-bit predicate constraint element count

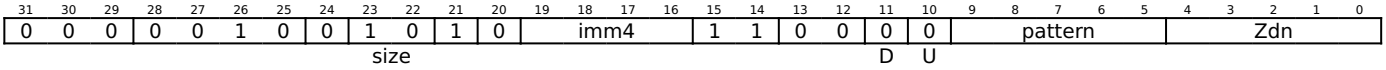
This instruction determines the number of Active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 32-bit signed integer range.
The named predicate constraint limits the number of Active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SQINCW <Zdn>.S{, <pattern>{, MUL #<imm>}}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let dn : integer = UInt(Zdn);
let pat : bits(5) = pattern;
let imm : integer = UInt(imm4) + 1;

let unsigned : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
1xx00	#uimm5
1x0x1	#uimm5
1x010	#uimm5
101x1	#uimm5
10110	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let count : integer = DecodePredCount(pat, esize);
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    if unsigned then
        (result[e*:esize], -) = UnsignedSatQ{esize}(UInt(op1elt) + (count * imm));
    else
        (result[e*:esize], -) = SignedSatQ{esize}(SInt(op1elt) + (count * imm));
    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQNEG

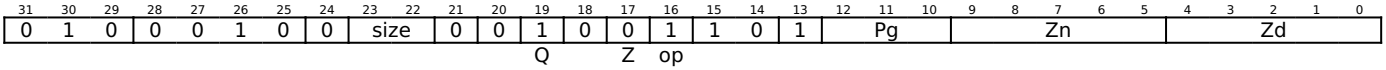
Signed saturating negate

This instruction negates the signed integer value in each Active element of the source vector, and places the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected.

It has encodings from 2 classes: Merging and Zeroing

Merging

(FEAT_SVE2 || FEAT_SME)



Encoding

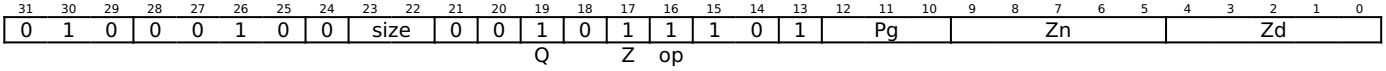
```
SQNEG <Zd>.<T>, <Pg>/M, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = TRUE;
```

Zeroing

(FEAT_SVE2p2 || FEAT_SME2p2)



Encoding

```
SQNEG <Zd>.<T>, <Pg>/Z, <Zn>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p2) && !IsFeatureImplemented(FEAT_SME2p2) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let merging : boolean = FALSE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(n) else Zeros{VL};
var result : bits(VL) = if merging then Z{VL}(d) else Zeros{VL};

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        var element : integer = SInt(operand[e*:esize]);
        element = -element;
        result[e*:esize] = SignedSat{esize}(element);

    end;
end;
Z{VL}(d) = result;
```

Operational information

For the "Merging" variant:
The merging variant of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and the merging variant of this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as the merging variant of this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of the merging variant of this instruction.
- The MOVPRFX must specify the same destination register as the merging variant of this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of the merging variant of this instruction.

SQRDCMLAH (indexed)

Saturating rounding doubling complex integer multiply-add high by indexed element

This instruction multiplies without saturation the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180, or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

This instruction then doubles and adds the products to the corresponding components of the complex numbers in the addend vector, and destructively places the most significant rounded half of the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

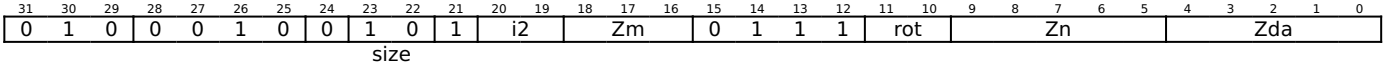
These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 16-bit and 32-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

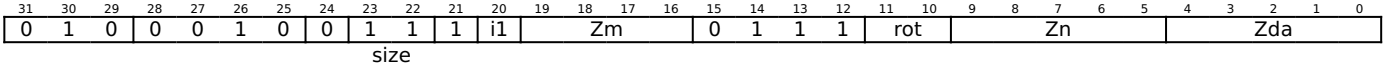
```
SQRDCMLAH <Zda>.H, <Zn>.H, <Zm>.H[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
let sel_a : integer = UInt(rot[0]);
let sel_b : integer = UInt(NOT(rot[0]));
let sub_r : boolean = (rot[0] != rot[1]);
let sub_i : boolean = (rot[1] == '1');
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRDCMLAH <Zda>.S, <Zn>.S, <Zm>.S[<imm>], <const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;

SQRDMLAH (indexed)

Signed saturating rounding doubling multiply-add high by indexed element

This instruction multiplies all signed elements within each 128-bit segment of the first source vector by the specified signed element of the corresponding second source vector segment, and then doubles the result and destructively adds the rounded high half of each result to the corresponding elements of the addend and destination vector. Each destination element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

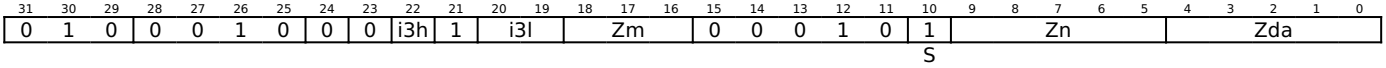
Each destination element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

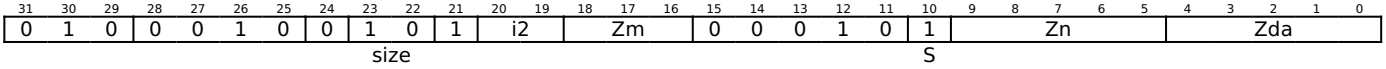
```
SQRDMLSH <Zda>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

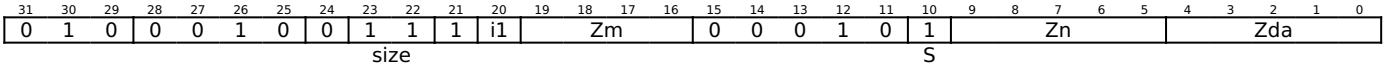
```
SQRDMLSH <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRDMLSH <Zda>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let segmentbase : integer = e - (e MOD eltspersegment);
    let s : integer = segmentbase + index;
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[s*:esize]);
    let element3 : integer = SInt(operand3[e*:esize]);
    let res : integer = (element3 << esize) - (2 * element1 * element2);
    result[e*:esize] = SignedSat{esize}((res + (1 << (esize - 1))) >> esize);

end;
Z{VL}(da) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

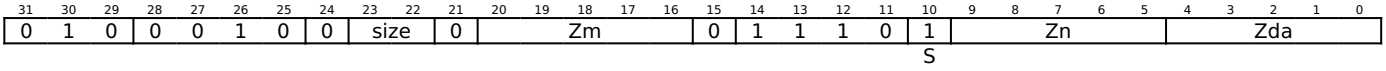
SQRDMLSH (vectors)

Signed saturating rounding doubling multiply-subtract high (unpredicated)

This instruction multiplies the signed elements of the first source vector by the corresponding elements of the second source vector, and then doubles the result and destructively subtracts the rounded high half of each result from the corresponding elements of the addend and destination vector. Each destination element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRDMLSH <Zda>.<T>, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let da : integer = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
let operand3 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    let element2 : integer = SInt(operand2[e*:esize]);
    let element3 : integer = SInt(operand3[e*:esize]);
    let res : integer = (element3 << esize) - (2 * element1 * element2);
    result[e*:esize] = SignedSat{esize}((res + (1 << (esize - 1))) >> esize);

end;
Z{VL}(da) = result;
```

SQRDMULH (indexed)

Signed saturating rounding doubling multiply high by indexed element

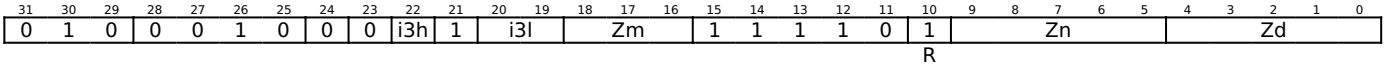
This instruction multiplies all signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, then doubles and places the most significant rounded half of the result in the corresponding elements of the destination vector register. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.

The elements within the second source vector are specified using an immediate index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

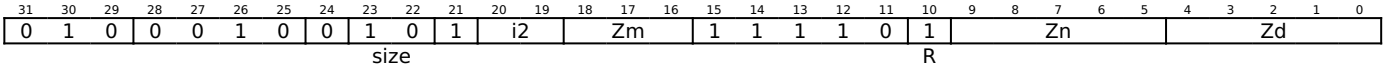
```
SQRDMULH <Zd>.H, <Zn>.H, <Zm>.H[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let index : integer = UInt(i3h::i3l);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

32-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

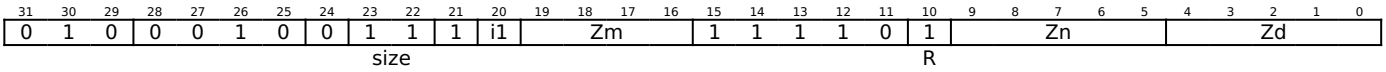
```
SQRDMULH <Zd>.S, <Zn>.S, <Zm>.S[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 32;
let index : integer = UInt(i2);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

64-bit

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRDMULH <Zd>.D, <Zn>.D, <Zm>.D[<imm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 64;
let index : integer = UInt(i1);
let n : integer = UInt(Zn);
let m : integer = UInt(Zm);
let d : integer = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the "16-bit" and "32-bit" variants: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the "64-bit" variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the "16-bit" variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the "32-bit" variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the "64-bit" variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let eltspersegment : integer = 128 DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(m);
var result : bits(VL);

for e = 0 to elements-1 do

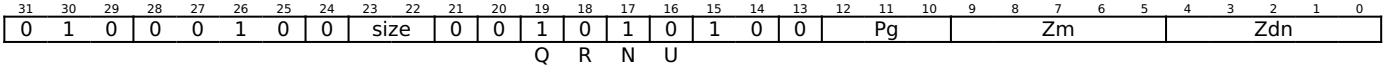
SQRSHL

Signed saturating rounding shift left (predicated)

This instruction shifts Active signed elements of the first source vector by corresponding elements of the second source vector, and destructively places the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRSHL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8 << UInt(size);
let g : integer = UInt(Pg);
let m : integer = UInt(Zm);
let dn : integer = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
let operand1 : bits(VL) = Z{}(dn);
let operand2 : bits(VL) = if AnyActiveElement{PL}(mask, esize) then Z{VL}(m) else Zeros{VL};
var result : bits(VL);

for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        let element : integer = SInt(operand1[e*:esize]);
        var shift : integer = ShiftSat(SInt(operand2[e*:esize]), esize);
        var res : integer;
        if shift >= 0 then
            res = element << shift;
        else
            shift = -shift;
            res = (element + (1 << (shift - 1))) >> shift;
        end;
        result[e*:esize] = SignedSat{esize}(res);
    else
        result[e*:esize] = operand1[e*:esize];

    end;
end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQRSHRN

Signed saturating rounding shift right narrow by immediate to interleaved integer

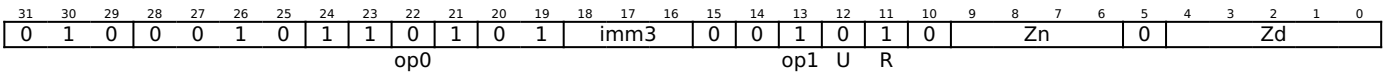
This instruction shifts right by an immediate value the signed integer value in each element of the two source vectors, and places the two-way interleaved rounded results in the half-width destination elements. Each result element is saturated to the half-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. The immediate shift amount is an unsigned value in the range 1 to number of bits per destination element.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit and 16-bit

8-bit

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

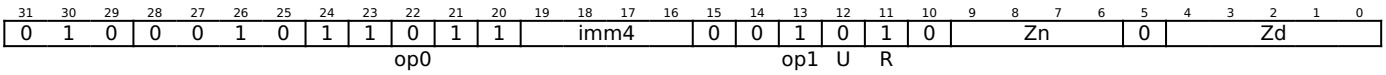
```
SQRSHRN <Zd>.B, { <Zn1>.H-<Zn2>.H }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm3);
```

16-bit

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
SQRSHRN <Zd>.H, { <Zn1>.S-<Zn2>.S }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm4);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<const>	For the "8-bit" variant: is the immediate shift amount, in the range 1 to 8, encoded as 8 minus "imm3". For the "16-bit" variant: is the immediate shift amount, in the range 1 to 16, encoded as 16 minus "imm4".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for e = 0 to elements-1 do
    for i = 0 to 1 do
        let operand : bits(VL) = Z{}(n+i);
        let element : bits(2 * esize) = operand[e*:(2 * esize)];
        let res : integer = (SInt(element) + (1 << (shift-1))) >> shift;
        result[(2*e + i)*:esize] = SignedSat{esize}(res);
    end;
end;

Z{VL}(d) = result;
```

SQRSHRUN

Signed saturating rounding shift right unsigned narrow by immediate and interleave

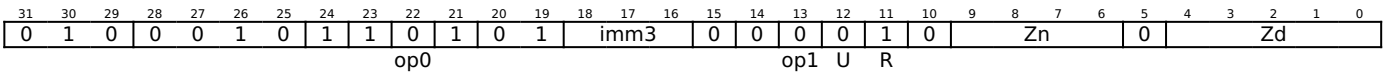
This instruction shifts right by an immediate value the signed integer value in each element of the two source vectors, and places the two-way interleaved rounded results in the half-width destination elements. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per destination element.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit and 16-bit

8-bit

(FEAT_SVE2p3 || FEAT_SME2p3)



Encoding

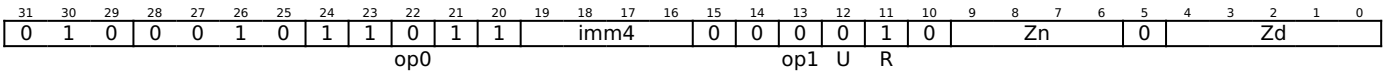
```
SQRSHRUN <Zd>.B, { <Zn1>.H-<Zn2>.H }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2p3) && !IsFeatureImplemented(FEAT_SME2p3) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 8;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm3);
```

16-bit

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
SQRSHRUN <Zd>.H, { <Zn1>.S-<Zn2>.S }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let esize : integer{} = 16;
let n : integer = UInt(Zn::'0');
let d : integer = UInt(Zd);
let shift : integer = esize - UInt(imm4);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn1>	Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.
<const>	For the "8-bit" variant: is the immediate shift amount, in the range 1 to 8, encoded as 8 minus "imm3". For the "16-bit" variant: is the immediate shift amount, in the range 1 to 16, encoded as 16 minus "imm4".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
var result : bits(VL);

for e = 0 to elements-1 do
    for i = 0 to 1 do
        let operand : bits(VL) = Z{}(n+i);
        let element : bits(2 * esize) = operand[e*:(2 * esize)];
        let res : integer = (SInt(element) + (1 << (shift-1))) >> shift;
        result[(2*e + i)*:esize] = UnsignedSat{esize}(res);
    end;
end;

Z{VL}(d) = result;
```

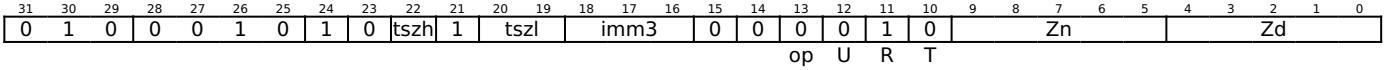
SQRSHRUNB

Signed saturating rounding shift right narrow by immediate to unsigned integer (bottom)

This instruction shifts each signed integer value in the source vector elements right by an immediate value, and places the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQRSHRUNB <Zd>.<T>, <Zn>.<Tb>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(3) = tszh::tszl;
if tsize == '000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

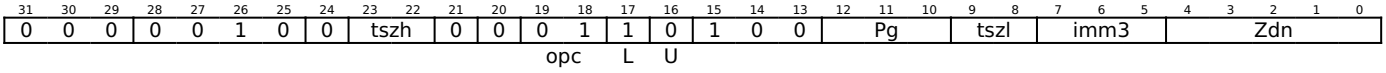
SQSHL (immediate)

Signed saturating shift left by immediate

This instruction shifts left by immediate each Active signed element of the source vector, and destructively places the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. Inactive elements in the destination vector register remain unmodified.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SQSHL <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let g : integer = UInt(Pg);
let dn : integer = UInt(Zdn);
let shift : integer = UInt(tsize::imm3) - esize;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
let mask : bits(PL) = P{}(g);
var result : bits(VL);

for e = 0 to elements-1 do
    let element1 : integer = SInt(operand1[e*:esize]);
    if ActivePredicateElement{PL}(mask, e, esize) then
        let res : integer = element1 << shift;
        result[e*:esize] = SignedSat{esize}(res);
    else
        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.

- A predicated `MOVPRFX` must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The `MOVPRFX` must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQSHRUN

Signed saturating shift right narrow by immediate to interleaved unsigned integer

This instruction shifts right by an immediate value the signed integer value in each element of the two source vectors, and places the two-way interleaved truncated results in the half-width destination elements. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per destination element.
This instruction is unpredicated.

SQSUB (immediate)

Signed saturating subtract immediate (unpredicated)

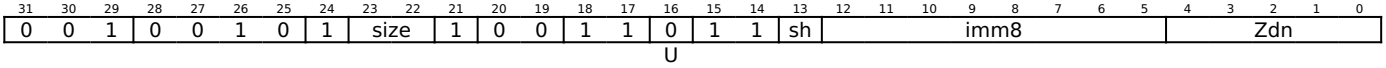
This instruction performs a signed saturating subtraction of an unsigned immediate from each element of the source vector, and destructively places the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm>, LSL #8". However, an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
SQSUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size::sh == '001' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << UInt(size);
let dn : integer = UInt(Zdn);
var imm : integer = UInt(imm8);
if sh == '1' then imm = imm << 8; end;
let unsigned : boolean = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(dn);
var result : bits(VL);

for e = 0 to elements-1 do
    let op1elt : bits(esize) = operand1[e*:esize];
    let element1 : integer = if unsigned then UInt(op1elt) else SInt(op1elt);
    (result[e*:esize], -) = SatQ{esize}(element1 - imm, unsigned);

end;
Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

        result[e*:esize] = operand1[e*:esize];
    end;
end;

Z{VL}(dn) = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX can be predicated or unpredicated.
- A predicated MOVPRFX must use the same governing predicate register as this instruction.
- A predicated MOVPRFX must use the larger of the destination element size and first source element size in the preferred disassembly of this instruction.
- The MOVPRFX must specify the same destination register as this instruction.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

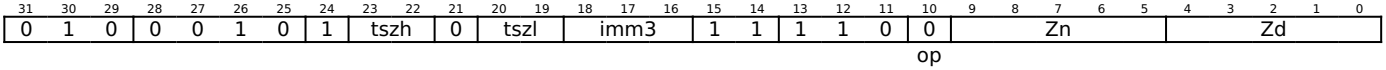
SRI

Shift right and insert (immediate)

This instruction shifts each source vector element right by an immediate value, and inserts the result into the corresponding vector element in the destination vector register, merging the shifted bits from each source element with existing bits in each destination vector element. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SRI <Zd>.<T>, <Zn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;

<Tb> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<Tb>
0	00	RESERVED
0	01	B
0	1x	H
1	xx	S

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let operand : bits(VL) = Z{}(n);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : bits(esize) = operand[(2*e + 0)*:esize];
    let shifted_value : integer = SInt(element) << shift;
    result[e*:(2*esize)] = shifted_value[2*esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

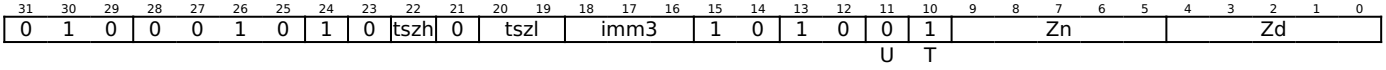
SSHLLT

Signed shift left long by immediate (top)

This instruction shifts left by immediate each odd-numbered signed element of the source vector, and places the results in the overlapping double-width elements of the destination vector. The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SSHLLT <Zd>.<T>, <Zn>.<Tb>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(3) = tszh::tszl;
if tsize == '000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let d : integer = UInt(Zd);
let shift : integer = UInt(tsize::imm3) - esize;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
0	00	RESERVED
0	01	H
0	1x	S
1	xx	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<Tb>
0	00	RESERVED
0	01	B
0	1x	H
1	xx	S

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV (2 * esize);
let operand : bits(VL) = Z{}(n);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : bits(esize) = operand[(2*e + 1)*:esize];
    let shifted_value : integer = SInt(element) << shift;
    result[e*:(2*esize)] = shifted_value[2*esize-1:0];
end;

Z{VL}(d) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

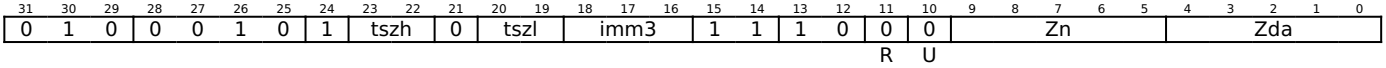
SSRA

Signed shift right and accumulate (immediate)

This instruction shifts right by immediate each signed element of the source vector, preserving the sign bit, and destructively adds the truncated intermediate result to the corresponding elements of the addend vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

SVE2

(FEAT_SVE2 || FEAT_SME)



Encoding

```
SSRA <Zda>.<T>, <Zn>.<T>, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE2) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
let tsize : bits(4) = tszh::tszl;
if tsize == '0000' then EndOfDecode(Decode_UNDEF); end;
let esize : integer{} = 8 << HighestSetBitNZ(tsize);
let n : integer = UInt(Zn);
let da : integer = UInt(Zda);
let shift : integer = (2 * esize) - UInt(tsize::imm3);
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “(tszh :: tszl)”:

tszh	tszl	<T>
00	00	RESERVED
00	01	B
00	1x	H
01	xx	S
1x	xx	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in "tszh:tszl:imm3".

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let elements : integer = VL DIV esize;
let operand1 : bits(VL) = Z{}(n);
let operand2 : bits(VL) = Z{}(da);
var result : bits(VL);

for e = 0 to elements-1 do
    let element : integer = SInt(operand1[e*:esize]) >> shift;
    result[e*:esize] = operand2[e*:esize] + element[esize-1:0];
end;

Z{VL}(da) = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is CONSTRAINED UNPREDICTABLE:

- The MOVPRFX must be unpredicated.
- The MOVPRFX must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

ST1B (scalar plus immediate, consecutive registers)

Contiguous store of bytes from multiple consecutive vectors (immediate index)

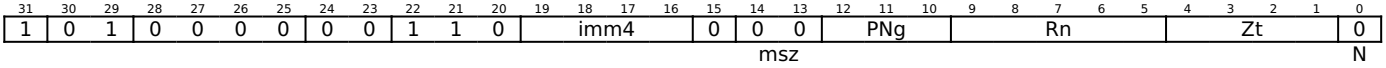
This instruction performs a contiguous store of bytes from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

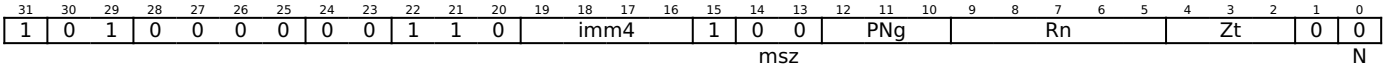
```
ST1B { <Zt1>.B-<Zt2>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1B { <Zt1>.B-<Zt4>.B }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mbytes : integer{} = esize DIV 8;
var base : bits(64);
var addr : bits(64);
let pred : bits(PL) = P{PL}(g);
let mask : bits(PL * nreg) = CounterToPredicate{PL*nreg}(pred[15:0]);
var src : bits(VL);
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let transfer : integer = t;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  tagchecked);

let esize : integer{} = 8 << UInt(size);
let msize : integer{} = 8;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var addr : bits(64);
var src : bits(VL);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = n != 31;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);
if !AnyActiveElement{PL}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
    src = Z{VL}(t);
end;
base = if n == 31 then SP{64}() else X{64}(n);
addr = AddressAdd(base, offset * elements * mbytes, accdesc);
for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        Mem{msize}(addr, accdesc) = src[e*:esize][msize-1:0];
    end;
    addr = AddressIncrement(addr, mbytes, accdesc);
end;
```

Operational information

ST1B (scalar plus scalar, consecutive registers)

Contiguous store of bytes from multiple consecutive vectors (scalar index)

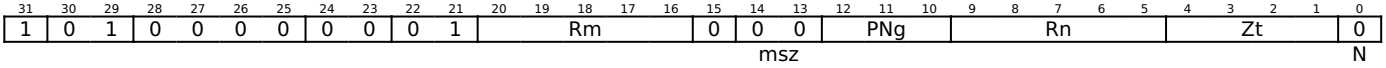
This instruction performs a contiguous store of bytes from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

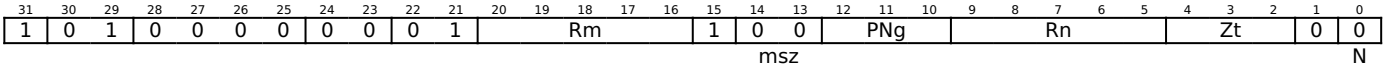
```
ST1B { <Zt1>.B-<Zt2>.B }, <PNg>, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 8;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1B { <Zt1>.B-<Zt4>.B }, <PNg>, [<Xn|SP>, <Xm>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 8;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mbytes : integer{} = esize DIV 8;
var offset : bits(64);
var base : bits(64);
var addr : bits(64);
let pred : bits(PL) = P{PL}(g);
let mask : bits(PL * nreg) = CounterToPredicate{PL*nreg}(pred[15:0]);
var src : bits(VL);
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let transfer : integer = t;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  tagchecked);

if !AnyActiveElement{PL*nreg}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
end;

base = if n == 31 then SP{64}() else X{64}(n);
offset = X{64}(m);
addr = AddressAdd(base, UInt(offset) * mbytes, accdesc);

ST1B (scalar plus vector)

Scatter store bytes from a vector (vector index)

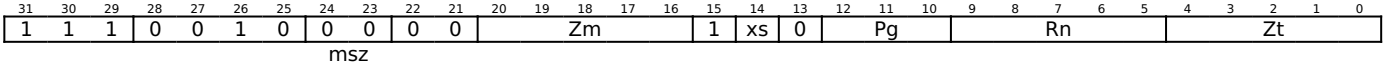
This instruction performs a scatter store of bytes from the Active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign-extended or zero-extended from 32 to 64 bits. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 3 classes: 32-bit unpacked unscaled offset , 32-bit unscaled offset and 64-bit unscaled offset

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

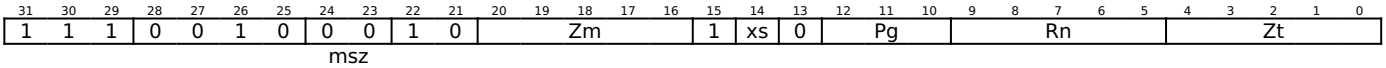
```
ST1B { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

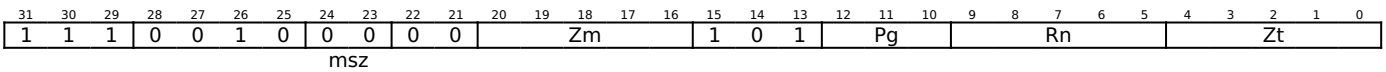
```
ST1B { <Zt>.S }, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 8;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
ST1B { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 8;
let offs_size : integer{} = 64;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

Operation

```
CheckNonStreamingSVEEnabled();

ST1D (scalar plus immediate, consecutive registers)

Contiguous store of doublewords from multiple consecutive vectors (immediate index)

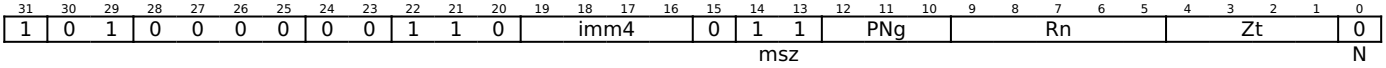
This instruction performs a contiguous store of doublewords from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

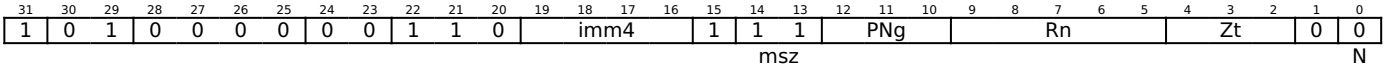
```
ST1D { <Zt1>.D-<Zt2>.D }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1D { <Zt1>.D-<Zt4>.D }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 64;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();

ST1D (scalar plus scalar, consecutive registers)

Contiguous store of doublewords from multiple consecutive vectors (scalar index)

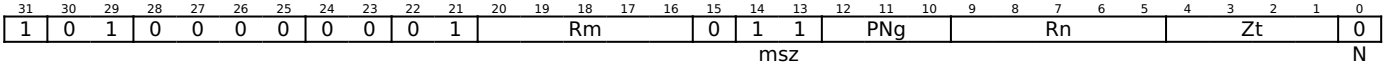
This instruction performs a contiguous store of doublewords from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

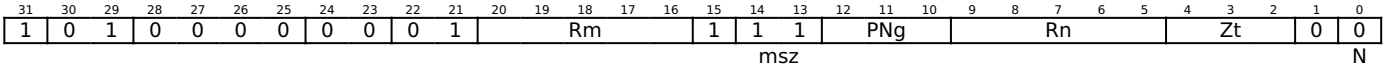
```
ST1D { <Zt1>.D-<Zt2>.D }, <PNg>, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 64;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1D { <Zt1>.D-<Zt4>.D }, <PNg>, [<Xn|SP>, <Xm>, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 64;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;

ST1D (scalar plus vector)

Scatter store doublewords from a vector (vector index)

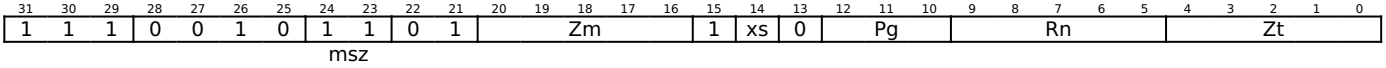
This instruction performs a scatter store of doublewords from the Active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 4 classes: 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

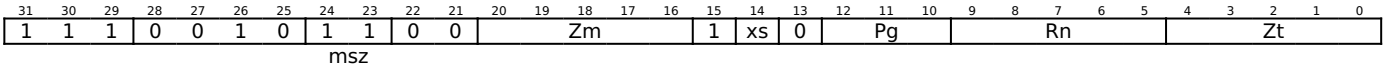
```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod> #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 3;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

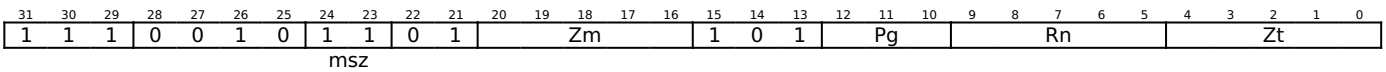
```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

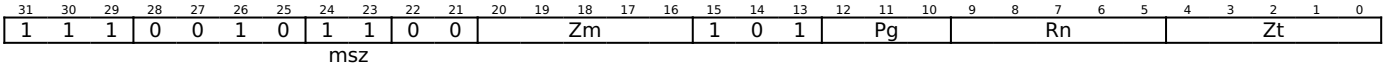
```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, LSL #3]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 64;
let offs_unsigned : boolean = TRUE;
let scale : integer = 3;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offs_size : integer{} = 64;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();

ST1D (vector plus immediate)

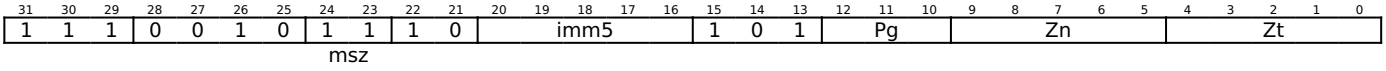
Scatter store doublewords from a vector (immediate index)

This instruction performs a scatter store of doublewords from the Active elements of a vector register to the memory addresses generated by a vector base plus immediate index. The index is a multiple of 8 in the range 0 to 248. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

SVE

(FEAT_SVE)



Encoding

```
ST1D { <Zt>.D }, <Pg>, [<Zn>.D{, #<imm>}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Zn);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 64;
let offset : integer = UInt(imm5);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 248, defaulting to 0, encoded in the "imm5" field.

Operation

```
CheckNonStreamingSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mask : bits(PL) = P{}(g);
var base : bits(VL);
var src : bits(VL);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = FALSE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);

ST1H (scalar plus immediate, consecutive registers)

Contiguous store of halfwords from multiple consecutive vectors (immediate index)

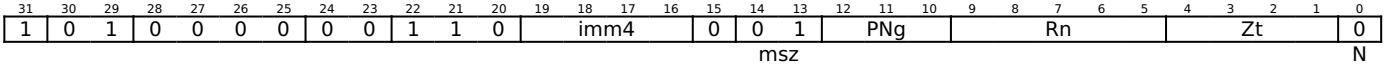
This instruction performs a contiguous store of halfwords from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

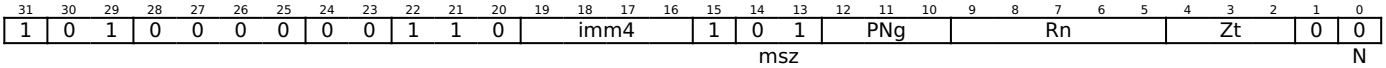
```
ST1H { <Zt1>.H-<Zt2>.H }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1H { <Zt1>.H-<Zt4>.H }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 16;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;

ST1H (scalar plus scalar, consecutive registers)

Contiguous store of halfwords from multiple consecutive vectors (scalar index)

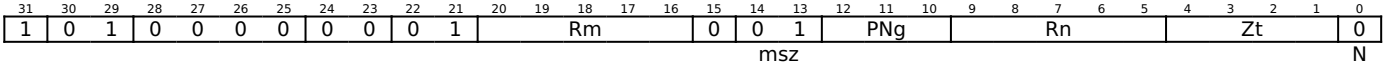
This instruction performs a contiguous store of halfwords from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and scalar index that is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

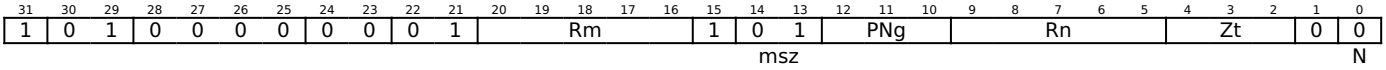
```
ST1H { <Zt1>.H-<Zt2>.H }, <PNg>, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 16;
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1H { <Zt1>.H-<Zt4>.H }, <PNg>, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 16;
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
let mbytes : integer{} = esize DIV 8;

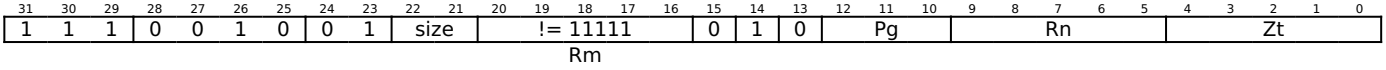
ST1H (scalar plus scalar, single register)

Contiguous store halfwords from vector (scalar index)

This instruction performs a contiguous store of halfwords from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index that is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory.

SVE

(FEAT_SVE || FEAT_SME)



Encoding

```
ST1H { <Zt>.<T> }, <Pg>, [<Xn|SP>, <Xm>, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) && !IsFeatureImplemented(FEAT_SME) then
    EndOfDecode(Decode_UNDEF);
end;
if size == '00' then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Rm);
let g : integer = UInt(Pg);
let esize : integer{} = 8 << UInt(size);
let msize : integer{} = 16;
```

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
let elements : integer = VL DIV esize;
var base : bits(64);
let mask : bits(PL) = P{}(g);
var offset : bits(64);
var addr : bits(64);
var src : bits(VL);
let mbytes : integer{} = msize DIV 8;
let contiguous : boolean = TRUE;
let nontemporal : boolean = FALSE;
let predicated : boolean = TRUE;
let tagchecked : boolean = TRUE;
let accdesc : AccessDescriptor = CreateAccDescSVE(MemOp_STORE, nontemporal, contiguous,
                                                  predicated, tagchecked);
if !AnyActiveElement{PL}(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    end;
else
    if n == 31 then CheckSPAlignment(); end;
    src = Z{VL}(t);
end;
base = if n == 31 then SP{64}() else X{64}(n);
offset = X{64}(m);
addr = AddressAdd(base, UInt(offset) * mbytes, accdesc);
for e = 0 to elements-1 do
    if ActivePredicateElement{PL}(mask, e, esize) then
        Mem{msize}(addr, accdesc) = src[e*:esize][msize-1:0];
    end;
    addr = AddressIncrement(addr, mbytes, accdesc);
end;
```

ST1H (scalar plus vector)

Scatter store halfwords from a vector (vector index)

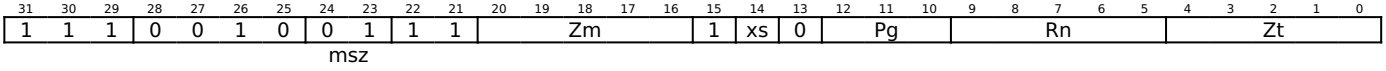
This instruction performs a scatter store of halfwords from the Active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign-extended or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

(FEAT_SVE)



Encoding

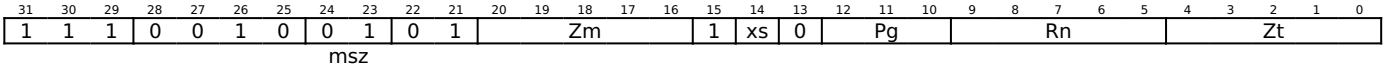
```
ST1H { <Zt>.S }, <Pg>, [<Xn|SP>, <Zm>.S, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked scaled offset

(FEAT_SVE)



Encoding

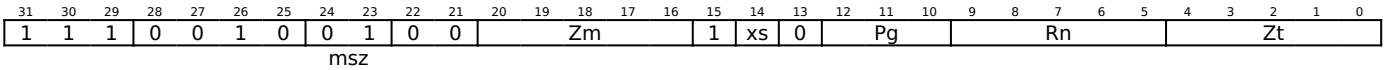
```
ST1H { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod> #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 1;
```

32-bit unpacked unscaled offset

(FEAT_SVE)



Encoding

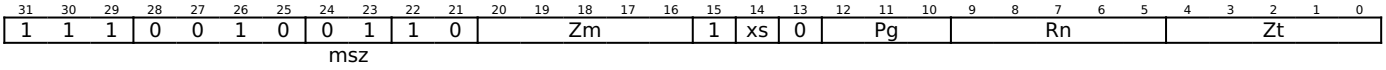
```
ST1H { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

32-bit unscaled offset

(FEAT_SVE)



Encoding

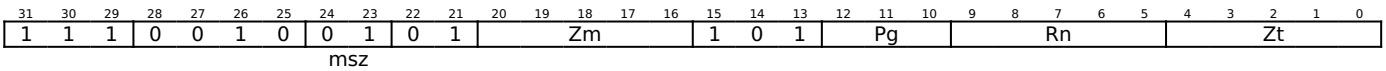
```
ST1H { <Zt>.S }, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 32;
let msize : integer{} = 16;
let offs_size : integer{} = 32;
let offs_unsigned : boolean = xs == '0';
let scale : integer = 0;
```

64-bit scaled offset

(FEAT_SVE)



Encoding

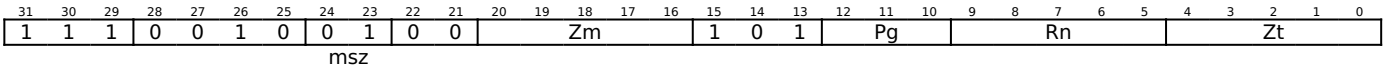
```
ST1H { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, LSL #1]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 64;
let offs_unsigned : boolean = TRUE;
let scale : integer = 1;
```

64-bit unscaled offset

(FEAT_SVE)



Encoding

```
ST1H { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SVE) then EndOfDecode(Decode_UNDEF); end;
let t : integer = UInt(Zt);
let n : integer = UInt(Rn);
let m : integer = UInt(Zm);
let g : integer = UInt(Pg);
let esize : integer{} = 64;
let msize : integer{} = 16;
let offs_size : integer{} = 64;
let offs_unsigned : boolean = TRUE;
let scale : integer = 0;
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Zm>	Is the name of the offset scalable vector register, encoded in the "Zm" field.
<mod>	Is the index extend and shift specifier, encoded in “xs”:

xs	<mod>
0	UXTW
1	SXTW

Operation

```
CheckNonStreamingSVEEnabled();

ST1W (scalar plus immediate, consecutive registers)

Contiguous store of words from multiple consecutive vectors (immediate index)

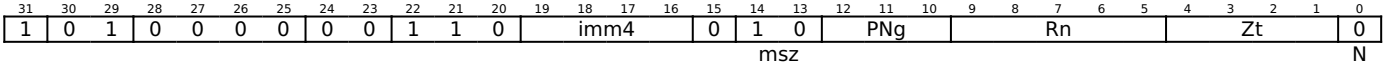
This instruction performs a contiguous store of words from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and immediate index that is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

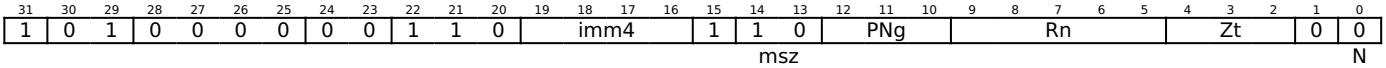
```
ST1W { <Zt1>.S-<Zt2>.S }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 2;
let t : integer = UInt(Zt::'0');
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Four registers

(FEAT_SME2 || FEAT_SVE2p1)



Encoding

```
ST1W { <Zt1>.S-<Zt4>.S }, <PNg>, [<Xn|SP>{, #<imm>, MUL VL}]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) && !IsFeatureImplemented(FEAT_SVE2p1) then
    EndOfDecode(Decode_UNDEF);
end;
let n : integer = UInt(Rn);
let g : integer = UInt('1'::PNg);
let nreg : integer{} = 4;
let t : integer = UInt(Zt::'00');
let esize : integer{} = 32;
let offset : integer = SInt(imm4);
```

Assembler Symbols

<Zt1>	For the "Two registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2. For the "Four registers" variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
<Zt2>	Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
<PNg>	Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded as "PNg" plus 8.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	For the "Two registers" variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded as "imm4" times 2. For the "Four registers" variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded as "imm4" times 4.
<Zt4>	Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

Operation

```
if IsFeatureImplemented(FEAT_SVE2p1) then
    CheckSVEEnabled();
else
    CheckStreamingSVEEnabled();
end;
let VL : integer{} = CurrentVL();
let PL : integer{} = VL DIV 8;
